Rare Metal Extraction by Chemical Engineering Techniques describes the use of chemical engineering techniques in the extraction and purification of rare metals such as uranium, thorium, and zirconium as well as hafnium, titanium, beryllium, and vanadium. The various chemical extraction stages from ore to metal are discussed. Comprised of nine chapters, this book begins with an examination of ore breakdown processes including dilute acid leaching and the breakdown of concentrated acids, alkalis, and fluorides as well as chlorination. The reader is then introduced to ion-exchange purification; solvent extraction; and dryway conversion processes.

Subsequent chapters focus on metal production by high-temperature reduction techniques; molten salt electrolytic processes; and iodide decomposition processes. The final chapter includes a selection of complete flowsheets for the extraction and

purification rare metals from ores. This monograph will be of value to metallurgists, chemical engineers, chemists, and others who are interested in the extraction of rare metals.

Waste electrical and electronic equipment (WEEE) generation is a global problem. Despite the growing awareness and deterring legislation, most of the WEEE is disposed improperly, i.e. landfilled or otherwise shipped overseas, and treated in sub-standard conditions. Informal recycling of WEEE has catastrophic effects on humans and the environment. WEEE contains considerable quantities of valuable metals such as base metals, precious metals and rare earth elements (REE). Metal recovery from WEEE is conventionally carried out by pyrometallurgical and hydrometallurgical methods. In this PhD research, novel metal recovery technologies from WEEE are investigated. Using acidophilic and cyanide-generating bacteria, copper and gold were removed from crushed electronic waste with removal efficiencies of 98.4 and 44.0%, respectively. The leached metals in solution were recovered using sulfidic precipitation and electrowinning separation techniques. Finally, a techno-economic assessment of the technology was studied. This research addresses the knowledge gap on two metal extraction approaches, namely chemical and biological, from a secondary source of metals. The essential parameters of the selective metal recovery processes, scale-up potential, techno-economic and sustainability assessment have been studied. The objective of these proceedings is to encourage engineering professionals,

The work is divided into the chapters: Chemical Engineering Measurement and Instrumentation, Transport Processes of Chemical Engineering, Chemical Separation Engineering, Industrial Catalysis, Chemical Systems Engineering, Inorganic and Organic Chemical Engineering, Biochemical Industry, Electrochemical Engineering, Green Chemical Processing Technology and Chemistry Science and Applied Chemistry. It constitutes a comprehensive guide to these subjects.

Investigation for a systematic study of oxygen equilibrium data for the analysis of the pressure leaching process for the recovery of zinc from sulfide concentrates. The solubilities of oxygen were measured at 95C, 125C, 155C, and 185C for three partial pressures of oxygen (4 atm, 7 atm, 10 atm) and for aqueous sulfuric acid solutions containing zinc and iron sulfate salts. A two-stage program for solubility determinations, consisting of a high pressure, high temperature absorption step and a low pressure (atmospheric) desorption step at 50C, was developed and data is reported on oxygen solubilities in the various solutions at 50C and atmospheric pressure. Oxygen solubilities were also measured in a concentrated zinc sulfate solution containing 0.3 g/L of surfactant Lignosol, and in an industrial sample obtained from the pressure leaching unit of Cominco at Trail, B.C.

Chemical Engineering Volume 2 covers the properties of particulate systems, including the character of individual particles and their behaviour in fluids. Sedimentation of particles, both singly and at high concentrations, flow in packed and fluidised beds and filtration are then examined. The latter part of the book deals with separation processes, such as distillation and gas absorption, which illustrate applications of the fundamental principles of mass transfer introduced in Chemical Engineering Volume 1. In conclusion, several techniques of growing importance - adsorption, ion exchange, chromatographic and membrane separations, and process intensification - are described. A logical progression of chemical engineering concepts, volume 2 builds on

fundamental principles contained in Chemical Engineering volume 1 and these volumes are fully cross-referenced Reflects the growth in complexity and stature of chemical engineering over the last few years Supported with further reading at the end of each chapter and graded problems at the end of the book

Gold leaching process with thiosulphate solutions is an important process of considerable significance for environmental and economic aspects of sustainability. Thiosulphate leaching helps reduce risks of environmental pollution in comparison with cyanidation, thus limiting negative societal effects, but complexity of the process chemistry still requires investigation and modeling. The objective of this work is to create models of gold leaching in various types of reactors. The results show that batch reactor model fits to experimental data, continuous reactor model allows utilizing it in scheme of series of apparatuses and cascade reactor model makes it possible to evaluate optimal number of reactors in series.
