The International Space Station (ISS) is the unique blend of unified and diversified goals among the world's space agencies that will lead to improvement in life on Earth for all people of all nations. While the various space agency partners may emphasize different aspects of research to achieve their goals in the use of the ISS, they are unified in several important overarching goals. All of the agencies recognize the importance of leveraging the ISS as an education platform to encourage and motivate today's youth to pursue careers in math, science, engineering, and technology (STEM): educating the children of today to be the leaders and space explorers of tomorrow. Advancing our knowledge in the areas of human physiology, biology, and material and physical sciences and translating that knowledge to health, socioeconomic, and environmental benefits on Earth is another common goal of the agencies: returning the knowledge gained in space research for the benefit of society. Finally, all the agencies are unified in their goals to apply knowledge gained through ISS research in human physiology, radiation, materials science, engineering, biology, fluid physics, and

technology: enabling future space exploration mission. The International Space Station (ISS) is a great international, technological, and political achievement. It is the latest step in humankind's quest to explore and live in space. The research done on the ISS may advance our knowledge in various areas of science, enable us to improve life on this planet, and give us the experience and increased understanding that can eventually equip us to journey to other worlds. As a result of the Station's complexity, few understand its configuration, its design and component systems, or the complex operations required in its construction and operation. This book provides high-level insight into the ISS. The ISS is in orbit today, operating with a crew of three. Its assembly will continue through 2010. As the ISS grows, its capabilities will increase, thus requiring a larger crew.

Assembly of the International Space Station (ISS) is a remarkable achievement. Since November 2000 humankind has maintained a continuous presence in space. Over this timespan, the ISS International Partnership has flourished. We have learned much about construction and about how humans and spacecraft systems function in orbit. But there is much more to do and learn, and this voyage of research and discovery is just beginning. As a national laboratory, the ISS is beginning to provide new opportunities for other agencies, academia, and commercial and other partner to pursue novel avenues of research and

development, and to promote science, technology, engineering, and math education. We cannot now foresee all that may be uncovered on this voyage, but we look forward to the voyage and returning knowledge to extend the human presence beyond and improve life here on Earth.

NASA's history is a familiar story, one that typically peaks with Neil Armstrong taking his small step on the Moon in 1969. But America's space agency wasn't created in a vacuum. It was assembled from pre-existing parts, drawing together some of the best minds the non-Soviet world had to offer. In the 1930s, rockets were all the rage in Germany, the focus both of scientists hoping to fly into space and of the German armed forces, looking to circumvent the restrictions of the Treaty of Versailles. One of the key figures in this period was Wernher von Braun, an engineer who designed the rockets that became the devastating V-2. As the war came to its chaotic conclusion, von Braun escaped from the ruins of Nazi Germany, and was taken to America where he began developing missiles for the US Army. Meanwhile, the US Air

Force was looking ahead to a time when men would fly in space, and test pilots like Neil Armstrong were flying cutting-edge, rocket-powered aircraft in the thin upper atmosphere. Breaking the Chains of Gravity tells the story of America's nascent space program, its scientific advances, its personalities and the rivalries it caused between the various arms of the US military. At this point getting a man in space became a national imperative, leading to the creation of the National Aeronautics and Space Administration, otherwise known as NASA.
