Design and manufacturing is the essential element in any product development lifecycle. Industry vendors and users have been seeking a common language to be used for the entire product development lifecycle that can describe design, manufacturing and other data pertaining to the product. Many solutions were proposed, the most successful being the Standard for Exchange of Product model (STEP). STEP provides a mechanism that is capable of describing product data, independent from any particular system. The nature of this description makes it suitable not only for neutral file exchange, but also as a basis for implementing, sharing and archiving product databases. ISO 10303-AP203 is the first and perhaps the most successful AP developed to exchange design data between different CAD systems. Going from geometric data (as in AP203) to features (as in AP224) represents an important step towards having the right type of data in a STEP-based CAD/CAM system. Of particular significance is the publication of STEP-NC, as an extension of STEP to NC, utilising feature-based concepts for CNC machining purposes. The aim of this book is to provide a snapshot of the recent research outcomes and implementation cases in the field of design and manufacturing where STEP is used as the primary data representation protocol. The 20 chapters are contributed by authors from most of the top research teams in the world. These research teams are based in national research institutes, industries as well as universities.

Getting Started with CNC is the definitive introduction to working with affordable desktop and benchtop CNCs, written by the creator of the popular open hardware CNC, the Shapeoko. Accessible 3D printing introduced the masses to computer-controlled additive fabrication. But the flip side of that is subtractive fabrication: instead of adding material to create a shape like a 3D printer does, a CNC starts with a solid piece of material and takes away from it. Although inexpensive 3D printers can make great things with plastic, a CNC can carve highly durable pieces out of a block of aluminum, wood, and other materials.

This book covers the fundamentals of designing for--and working with--affordable (\$500-\$3000) CNCs.

If you've spent any amount of time in manufacturing, you know that efficiency matters. Michael Cope, the author of this book, was co-owner of a job shop before he joined Hurco. As a machinist and applications engineer, he always evaluates the most efficient way to approach a part to minimize setup time and reduce cycle time. It's just part of his DNA. That's precisely why he is such a proponent of 5-axis CNC. Adopting a 5-sided machining process is the most efficient way to instantly increase the profit margin on existing jobs that you manufacture on a conventional 3-axis machine. In this book, Mike breaks down the information about 5-axis and 5-sided machining from a machinist's perspective. Whether you're just learning about 5-axis machining or you're already adept at 5-axis, you'll learn something new. A great go-to book written for machinists by a machinist.

This is the third volume of three which will give the reader an insight into the current state of CNC technology with a focus on practical applications. This volume deals with CNC programming. It has been written in conjunction with a major European supplier of controllers in order to give the reader a more consistent and in-depth understanding of the logic used to program such machines. It explains how why and where to program specific features of a part and how to build them up into complete programs. Thus, the reader will learn about the main aspects of the logical structure and compilation of a program. Finally, there is a brief review of some of the typical controllers currently available from both universal and proprietary builders. The author draws on his extensive experience as a practitioner and teacher. The text is thoroughly practical in character and generously illustrated with diagrams and photographs.
