During the last few decades, research into natural products has advanced tremendously thanks to contributions from the fields of chemistry, life sciences, food science and material sciences. Comparisons of natural products from microorganisms, lower eukaryotes, animals, higher plants and marine organisms are now well documented. This book provides an easy-to-read overview of natural products. It includes twelve chapters covering most of the aspects of natural products chemistry. Each chapter covers general introduction, nomenclature, occurrence, isolation, detection, structure elucidation both by degradation and spectroscopic techniques, biosynthesis, synthesis, biological activity and commercial applications, if any, of the compounds mentioned in each topic. Therefore it will be useful for students, other researchers and industry. The introduction to each chapter is brief and attempts only to supply general knowledge in the particular field. Furthermore, at the end of each chapter there is a list of recommended books for additional study and a list of relevant questions for practice.

The third edition of Concepts in Biochemistry makes the most applied and accessible biochemistry text on the market. Students are more successful with Boyer because it isn't intimidating and it makes clear the relevance of the material to their future careers. Like the first two editions, Boyer is written for students who need an introduction to the fundamental principles of biochemistry and are preparing for a career in the allied health sciences, the biological sciences, and the environmental sciences. (The text is also appropriate for use in one-semester courses developed for chemistry majors as a result of the new American Chemical Society requirements for three-credit hours of biochemistry coursework.) The modern, student-friendly organization sets the book apart from the competition because the early placement of nucleic acids enhances the traditional coverage of protein structure and function, and metabolism. As an example, it is now possible to present metabolism in a more contemporary fashion, emphasizing gene regulation and integration. Rod Boyer is a recently retired Professor of Chemistry and Biochemistry at Hope College in Holland, Michigan. He has a PhD from Colorado State and recently spent a sabbatical year at Nobel Prize winner Tom Cech's lab at the University of Colorado. He is on the Editorial Board for the journal, Biochemistry and Molecular Biology Education and has been very active in education affairs for the American Society for Biochemistry and Molecular Biology.

We present to our readers the proceedings of the Second International Workshop on Phosphate. A short account of the history of the effort led to the Phosphate Workshops is appropriate and can be of interest to the reader. The idea for Phosphate Workshops was born in the early days of November, 1974. One of us (S. G. M. ) suggested the thought to a group of scientists gathered for a luncheon in one of the attractive small restaurants in Weisbaden, Germany. The purpose of the workshop was to bring together interested scientists to discuss the newer developments and the recent advances in the field of phosphate metabolism and the other related minerals. An Organizing Committee made of Shaul G. Massry (USA), Louis V. Avioli (USA), Philippe Bordier (France), Herbert Fleisch (Switzerland), and Eduardo Slatopolsky (USA) was formed. The First Workshop was held in Paris during June 5-6, 1975 and was hosted by Dr. Philippe Bordier. Its proceeding was already published. The Second Workshop took place in Heidelberg during June 28-30, 1976 and was hosted by Dr. Eberhard Ritz. Both of these workshops were extremely successful scientific endeavors, and the need for them was demonstrated by the great interest they generated among the scientific community. The Organizing Committee, therefore, decided to continue with the tradition to hold additional Workshops annually or every other year.

Organic chemistry is the chemistry of compounds of carbon. The ability of carbon to link together to form long chain molecules and ring compounds as well as bonding with many other elements has led to a vast array of organic compounds. These compounds are central to life, forming the basis for organic molecules such as nucleic acids, proteins, carbohydrates, and lipids. In this Very Short Introduction Graham Patrick covers the whole range of organic compounds and their roles. Beginning with the structures and properties of the basic groups of organic compounds, he goes on to consider organic compounds in the areas of pharmaceuticals, polymers, food and drink, petrochemicals, and nanotechnology. He looks at how new materials, in particular the single layer form of carbon called graphene, are opening up exciting new possibilities for applications, and discusses the particular challenges of working with carbon compounds, many of which are colourless. Patrick also discusses techniques used in the field. ABOUT THE SERIES: The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area. These pocket-sized books are the perfect way to get ahead in a new subject quickly. Our expert authors combine facts, analysis, perspective, new ideas, and enthusiasm to make interesting and challenging topics highly readable.

A concise introductory textbook in biochemistry and molecular biology for life sciences students taking a first course in the topic. Professor William Elliott from University of Adelaide, Dr Daphne Elliott formerly at Flinders University.
