Introductory Statistics is designed for the one-semester, introduction to statistics course and is geared toward students majoring in fields other than math or engineering. This text assumes students have been exposed to intermediate algebra, and it focuses on the applications of statistical knowledge rather than the theory behind it. The foundation of this textbook is Collaborative Statistics, by Barbara Illowsky and Susan Dean. Additional topics, examples, and ample opportunities for practice have been added to each chapter. The development choices for this textbook were made with the guidance of many faculty members who are deeply involved in teaching this course. These choices led to innovations in art, terminology, and practical applications, all with a goal of increasing relevance and accessibility for students. We strove to make the discipline meaningful, so that students can draw from it a working knowledge that will enrich their future studies and help them make sense of the world around them.

Laboratory and Field Exercises in Sport and Exercise Biomechanics is the first book to fully integrate practical work into an introduction to the fundamental principles of sport and exercise biomechanics. The book concisely and accessibly introduces the discipline of biomechanics and describes the fundamental methods of analysing and interpreting biomechanical data, before fully explaining the major concepts underlying linear kinematics, linear kinetics, angular kinematics, angular kinetics and work, energy and power. To supplement chapters, the book includes nineteen practical worksheets which are designed to give students practice in collecting, analysing, and interpreting biomechanical data, as well as report writing. Each worksheet includes example data and analysis, along with data recording sheets for use by students to help bring the subject to life. No other book offers students a comparable opportunity to gain practical, hands-on experience of the core tenets of biomechanics. Laboratory and Field Exercises in Sport and Exercise Biomechanics is, therefore, an important companion for any student on a Sport and Exercise Science or Kinesiology undergraduate programme, or for any instructors delivering introductory biomechanics classes.

The sample world-wide satellite tracking program carried out by the Army Map Service is presented. By using satellites with known heights and inclinations and the coordinates of known points on geodetic datums, the coordinates of unknown points were related to these datums. The known and unknown points used in each segment of the program are presented, and the probable error in the correction to each unknown point is given. This program is intended to be a theoretical problem for testing the range error analysis theory and equations and the resulting errors which would be associated with each determined position; therefore, the coordinates used for the known and unknown points were taken from maps and gazetteers and are only approximate.
