Water is accepted as the most important source of life. It is assumed that life began in water and spread from there to the whole world. But water has been polluted anthropogenically since the beginning of the industrial revolution in the late 19th century. At the end of the 20th century, most water sources cannot be used for aquaculture, irrigation, and human use. Therefore, for sustainable development, we have to protect our water sources on Earth, because it's the only planet we have!

It covers a wide variety of MBR topics, including filtration theory, membrane materials and geometry, fouling phenomena and properties, and strategies for minimizing fouling. Also covered are the practical aspects such as operation and maintenance. Case studies and examples in the book help readers understand the basic concepts and principles clearly, while problems presented help advance relevant theories more deeply. Readers will find this book a helpful resource to understand the state of the art in MBR technology.

Contamination of aqueous environments by hazardous chemical compounds is the direct cause of the decline of safe clean water supply throughout the globe. The use of unconventional water sources such as treated wastewater will be a new norm. Emerging nanotechnological innovations have great potential for wastewater remediation processes. Applications that use smart nanomaterials of inorganic and organic origin improve treatment efficiency and lower energy requirements. This book describes the synthesis, fabrication, and application of advanced nanomaterials in water treatment processes; their adsorption, transformation into low toxic forms, or degradation phenomena, and the adsorption and separation of hazardous dyes, organic pollutants, heavy metals and metalloids from aqueous solutions. It explains the use of different categories of nanomaterials for various pollutants and enhances understanding of nanotechnology-based water remediation to make it less toxic and reusable.

Watermaths presents the mathematics underpinning the design and operation of the individual unit process technologies used for purifying water and wastewater. The book aims to provide the reader with sufficient information to enable them to tackle the most important calculations in this area, without requiring any prior knowledge of the subject and assuming only a very basic grounding in science or engineering. It focuses on the most essential areas of knowledge required, containing tuition in basic numeracy, chemistry, process engineering and fluid physics, as well as cost analysis. The simple and succinct delivery is designed to get the reader up to speed as rapidly as possible: sufficient background information is provided to explain the purpose of the calculations, and ultimately tackle the complete wastewater reclamation plant design problem included in the book. Example calculations are provided within each chapter, each followed by exercises intended to reinforce the learning (and for which solutions are appended). Exercises range in difficulty from simple single calculational-step problems to more complex ones, and the over-arching design problem provides some context to the mathematics. The book can be understood by those relatively new to the water sector, and is intended as a primer rather than a comprehensive handbook. It is nonetheless sufficiently comprehensive to permit design calculations for most water and wastewater

The municipal water industry, which is concerned with the provision of clean drinking water to the population, is a big user and developer of membrane technology which helps it to provide water free of pathogens, chemicals, odours and unwanted tastes. Municipal authorities also have to process sewage and waste water, and membranes are used extensively in these processes. The MBR Book covers all important aspects of Membrane

BioReactors in water and waste water treatment, from the fundamentals of the processes via design principles to MBR technologies. Industrial case studies help interpret actual results and give pointers for best practice. The release and accumulation of organic and inorganic pollutants in the environment by natural and anthropogenic sources have led to serious environmental problems; this subsequently results to adverse effects on human health and wildlife. Therefore, to prevent the harmful effects of environmental contaminants, the development of newer and/or combined technologies for the remediation of contaminated water and wastewaters has been of great importance. This book presents bioremediation, membrane bioreactor and the Advanced Oxidation Processes (AOPs) as other forms of water and wastewater treatment technologies. Bioremediation and membrane bioreactor are ecofriendly, effective and cheap methods of detoxification. The AOPs have also emerged as a set of versatile water and wastewater treatment techniques. AOPs have been widely applied for the removal of a wide range of contaminants including pharmaceuticals, dyes, surfactants, pesticides, herbicides, disinfection by-products, endocrine disrupting chemicals etc. However, there are still ongoing investigation on the impact of the oxidants used, nanoparticles/catalysts, and resultant metabolites on human health and the environment.

Biological phosphorus (bio-P) removal has become a reliable and well-understood process within wastewater treatment, despite being one of the most complex processes in the activated sludge process. Extended fundamental and full-scale research has been carried out into the bio-P process and the state-of-the-art is described in this report. A summarising historical overview gives insight into the establishment of the appropriate microbiological and biochemical basis of the process and the development of bio-P configurations in practice. Aspects of the bio-P process that have a direct influence on the efficiency of phosphorus

removal are subjected to an in-depth investigation. This report presents guidelines for design and dimensioning in order to introduce and/or optimise the bio-P process in practice. Twelve bio-P installations are extensively described and the operational results and experiences are related to existing bio-P knowledge and guidelines. Based on a number of parameters, a comparison is made between the described bio-P plants. A steady state model is verified with extensive periods of practical experience of the plants. The bio-P model, which is provided on CD-ROM (available for download here), offers a reliable insight into the bio-P process, coupled with sensitivity analyses regarding wastewater characteristics and process parameters for the anaerobic volume and the P-ortho concentration in the final effluent. The report ends with a systematic approach to the design of the bio-P process, based on the background of the bio-P process itself, much practical experience and the analysis of operational bio-P plants. Also presented is a systematic approach to tackle operational aspects of the bio-P process in order to generate an acceptable low P effluent concentration. This optimisation of the bio-P process operation is supported by a decision diagram. Biological Phosphorus Removal will be an invaluable source of information for all those concerned with wastewater treatment, including plant managers, process designers, consultants and researchers.

"Preface Membrane technology has been rapidly developed in recent decades to meet various needs from various industries. I was lucky to be a graduate student when the theories on membrane filtration were being matured and countless new technologies emerged in the 1990s. Membrane bioreactor (MBR) technology was one of the emerging technologies at the time, and it is now one of the most successful membrane processes of all time along with reverse osmosis (RO). I started MBR research in graduate school and continued it throughout my career as a research engineer of the LG group and Nalco. I have to admit I have been greatly indebted to everyone who contributed to the advance of membrane technology. Although the knowledge base of MBR has been expanded in the last two decades, the gaps between the leading edge academic research and the practical know-how obtained from the field have also been widened. Hoping to fill the gap, I started to share my experience in the academics and the field through my blog (<http://www.onlinembr.info>) since 2011. This open-source knowledge sharing was a great success, having more than 200 unique visitors a day globally, almost equally distributed among the Americas, Europe, and Asia. The questions and comments I received were a great source of new information and inspiration. With numerous encouragements from the audiences, I took courage to author this book. The contents in the blog were thoroughly reviewed and modified with additional fillers to make the contents more rigorous and complete. This book is written with an emphasis on the principles behind the scene instead of simply introducing the way MBR works. Chapters 1 and 2 are about the fundamentals of membrane filtration relevant to MBR. Chapter 2 is specifically about the"-- Current Developments in Biotechnology and Bioengineering: Bioprocesses, Bioreactors and Controls provides extensive coverage of new developments, state-of-the-art technologies, and potential future trends, reviewing industrial biotechnology and bioengineering practices that facilitate and enhance the transition of processes from lab to plant scale, which is becoming increasingly important as such transitions continue to grow in frequency. Focusing on industrial bioprocesses, bioreactors for bioprocesses, and controls for bioprocesses, this title reviews industrial practice to identify bottlenecks and propose solutions, highlighting that the optimal control of a bioprocess involves not only maximization of product yield, but also taking into account parameters such as quality assurance and environmental aspects. Describes industrial bioprocesses based on the reaction media Lists the type of bioreactors used for a specific bioprocess/application Outlines the principles of control systems in various bioprocesses

The steady increase in industrialization, urbanization and enormous population growth are leading to production of huge quantities of wastewaters that may frequently cause environmental hazards. This makes waste water treatment and waste water reduction very important issues. The book offers a collection of studies and findings concerning waste water treatment, minimization and reuse.

Osmotically driven membrane processes (ODMPs) including forward osmosis (FO) and pressure-retarded osmosis (PRO) have attracted increasing attention in fields such as water treatment, desalination, power generation, and life science. In contrast to pressure-driven membrane processes, e.g., reverse osmosis, which typically employs applied high pressure as driving force, ODMPs take advantages of naturally generated osmotic pressure as the sole source of driving force. In light of this, ODMPs possess many advantages over pressure-driven membrane processes. The advantages include low energy consumption, ease of equipment maintenance, low capital investment, high salt rejection, and high water flux. In the past decade, over 300 academic papers on ODMPs have been published in a variety of application fields. The number of such publications is still rapidly growing. The ODMPs' approach, fabrications, recent development and applications in wastewater treatment, power generation, seawater desalination, and gas absorption are presented in this book.

A membrane reactor is a device for simultaneously performing a reaction and a membrane-based separation in the same physical device. Therefore, the membrane not only plays the role of a separator, but also takes place in the reaction itself. This text covers, in detail, the preparation and characterisation of all types of membranes used in membranes reactors. Each membrane synthesis process used by membranologists is explained by well known scientists in their specific research field. The book opens with an exhaustive review and introduction to membrane reactors, introducing the recent advances in this field. The following chapters concern the preparation of both organic and inorganic, and in both cases, a deep analysis of all the techniques used to prepare membrane are presented and discussed. A brief historical introduction for each technique is also included, followed by a complete description of the technique as well as the main results presented in the international specialized literature. In order to give to the reader a summary look to the overall work, a conclusive chapter is included for collecting all the information presented in the previous chapters. Key features: Fills a gap in the market for a scientific book describing the preparation and characterization of all the kind of membranes used in membrane reactors Discusses an important topic - there is increasing emphasis on membranes in general, due to their use as energy efficient separation tools and the 'green' chemistry opportunities they offer Includes a review about membrane reactors, several chapters concerning the preparation organic, inorganic, dense, porous, and composite membranes and a conclusion with a comparison among the different membrane preparation techniques

This book deals with those processes that use semipermeable membranes to enhance or enable the biological treatment of wastewater. In this context biological treatment could involve aerobic or anaerobic processing with suspended and supported biomass, or biofilms. Membrane bioreactors for wastewater treatment are in a period of rapid development. Installations are growing at about 15% per annum. In addition to process evolution driven by industry there is a high level of research activity in academia and research organizations. Although there is a recent book (Judd, The MBR Book, Elsevier, 2006) comprehensively devoted to MBRs it can be anticipated that within the next 2 or 3 years there will be significant advances in understanding, operation and systems design to warrant a new book. In addition, the MBR Book (2006) has a bias towards the potential MBR practitioner and less reference to research and development issues. This new book will provide an update on the status of MBRs and report on cutting edge developments and fundamental insights that will enhance the application of the technology. The MBR is now part of the main stream or wastewater treatment. However the technology continues to develop rapidly and is the focus of intensive global research. This book provides a status report on MBR technology and provides details of cutting edge research and developments that are leading to enhanced MBR processes. Both academic researchers and industrial innovators have contributed their latest knowledge. Topics covered include the MBR status report, filtration systems performance (module design, hydrodynamics, energy), process configuration and design

options, fouling and cleaning, effluent water quality and MBR modelling. The emphasis is on aerobic MBRs but recent developments in anaerobic MBRs and novel MBR concepts, such as biofilm MBRs and microbial fuel cells are described.

This two-volume book on biomass is a reflection of the increase in biomass related research and applications, driven by overall higher interest in sustainable energy and food sources, by increased awareness of potentials and pitfalls of using biomass for energy, by the concerns for food supply and by multitude of potential biomass uses as a source material in organic chemistry, bringing in the concept of bio-refinery. It reflects the trend in broadening of biomass related research and an increased focus on second-generation bio-fuels. Its total of 40 chapters spans over diverse areas of biomass research, grouped into 9 themes. The MBR Book covers all essential aspects of membrane bioreactors in water and wastewater treatment, including the working principles of MBR technologies. The book aims to separate science from engineering, in an attempt to avoid confusion and to help readers understand the ideas of MBR. The third chapter covers the design, operation, and maintenance of MBR, including cost modeling and cost benefit analysis. Chapters 4 and 5 cover the commercial MBR products and their applications for water and wastewater treatment, respectively. The text features industrial case studies, along with useful appendices of commercial and international membrane organizations. The book serves as a primary reference for chemical, environmental, and process engineers, as well as environmental researchers, natural resources researchers, filtration specialists, water company managers, and consultants. Membrane Bioreactors are a major growth area in the water and waste water treatment industries. Internationally-known author, one of the leading senior experts in MBR research. The aim of this book is to look into textile wastewater treatments shortly. It is designed for readers who study on textile dyeing effluent. I would like to record my sincere thanks to authors for their contributions.
