It has been said that the normal English reaction to uncomfortable facts of life, such as Marxism, is an embarrassed but determined silence. That anyone should experience a desire to enquire into ideas as such, and to probe into the motives influencing them, seems extraordinary. Marxism is, however, subjected to a close study in this book, first published in 1957, and the collected essays attempt the task of combining certain elements in the heritage of modern culture with the insights of Marxism. There can be no vital thinking for our age that does not do justice to both traditions.

In this classic of scientific literature, the Nobel Laureate and creator of the quantum revolution explores the basics of physics, concluding with an engrossing narrative of how he developed quantum theory. 1925 edition.

How did epidemics, zoos, German exiles, methamphetamine, disgruntled technicians, modern bureaucracy, museums, and whipping cream shape the emergence of modern neuroscience?

Research on natural and artificial brains is proceeding at a rapid pace. However, the understanding of the essence of consciousness has changed slightly over the millennia, and only the last decade has brought some progress to the area. Scientific ideas emerged that the soul could be a product of the material body and that calculating machines could imitate brain processes. However, the authors of this book reject the previously common dualism—the view that the material and spiritual-psychic processes are separate and require a completely different substance as their foundation. Reductive Model of the Conscious Mind is a forward-thinking book wherein the authors identify processes that are the essence of conscious thinking and place them in the imagined, simplified structure of cells able to memorize and transmit information in the form of impulses, which they call neurons. The purpose of the study is to explain the essence of consciousness to the degree of development of natural sciences, because only the latter can find a way to embed the concept of the conscious mind in material brains. The book is divided into three parts. Part 1 works to convince readers that the emergence of consciousness does not require detailed knowledge of the structure and morphology of the brain, with the exception of some specific properties of the neural network structure that the authors attempt to point out. Part 2 proves that the biological structure of many natural brains fulfills the necessary conditions for consciousness and intelligent thinking. Similarly, Part 3 shows the ways in which artificial creatures imitating natural brains can meet these conditions, which gives great hopes for building artificially intelligent beings endowed with consciousness. Covering topics that include cognitive architecture, the embodied mind, and machine learning, this book is ideal for cognitive scientists, philosophers of mind, neuroscientists, psychologists, researchers, academicians, and advanced-level students. The book can also help to focus the research of linguists, neurologists, and biophysicists on the biophysical basis of postulated information processing into knowledge structures.

This book formulates a theory of global rhetoric encompassing Eastern and Western approaches. Based on the Field-Being philosophy, this book delves into the ontological foundations of both kinds of rhetoric and argues that both understandings are necessary for global communication.

works treat themes related to the mental world, occultism, divination, psychic reality, and mankind's nature. "THERE EXISTS IN NATURE A DYNAMIC MENTAL PRINCIPLE—A MIND-POWER—PERVADING ALL SPACE—IMMANENT IN ALL THINGS—MANIFESTING IN AN INFINITE VARIETY OF FORMS, DEGREES, AND PHASES. I hold that this energy, or force, or dynamic principle, is no respecter of persons. Its service, like that of the sun and rain, and all natural forces, is open to all—just and unjust; good and bad; high and low; rich and poor. It responds to the proper efforts, no matter by whom exerted, or for what purpose called into effect." (Extract)

Introduction to Petroleum Seismology, second edition (SEG Investigations in Geophysics Series No. 12) provides the theoretical and practical foundation for tackling present and future challenges of petroleum seismology especially those related to seismic survey designs, seismic data acquisition, seismic and EM modeling, seismic imaging, microseismicity, and reservoir characterization and monitoring. All of the chapters from the first edition have been improved and/or expanded. In addition, twelve new chapters have been added. These new chapters expand topics which were only alluded to in the first edition: sparsity representation, sparsity and nonlinear optimization, near-simultaneous multiple-shooting acquisition and processing, nonuniform wavefield sampling, automated modeling, elastic-electromagnetic mathematical equivalences, and microseismicity in the context of hydraulic fracturing. Another major modification in this edition is that each chapter contains analytical problems as well as computational problems. These problems include MatLab codes, which may help readers improve their understanding of and intuition about these materials. The comprehensiveness of this book makes it a suitable text for undergraduate and graduate courses that target geophysicists and engineers as well as a guide and reference work for researchers and professionals in academia and in the petroleum industry.

Current debate in cognitive science, from robotics to analysis of vision, deals with problems like the perception of form, the structure and formation of mental images and their modelling, the ecological development of artificial intelligence, and cognitive analysis of natural language. It focuses in particular on the presence of a hierarchy of intellectual constructions in different formats of representation. These diverse approaches, which share a common assumption of the inner nature of representation, call for a new epistemology - even a new psychophysics - based on a theory of reference which is intrinsically cognitive. As a contribution to contemporary research, the reading presents the core of theories developed in Central Europe between the late nineteenth and early twentieth centuries by philosophers, physicists, psychologists and semanticists who shared a dynamic approach and a pronounced concern with problems of interaction and dependence. These theories offer innovative solutions to some of the epistemological and philosophical problems currently at the centre of debate, like part-whole, theory of relations, and conceptual and linguistic categorization.
