So long as there are weaknesses that can be exploited for gain, companies, other organizations and private individuals will be taken advantage of. This theoretically-based but hugely practical book focuses on what is generally seen as financial or economic crime: theft, fraud, manipulation, and corruption. Petter Gottschalk considers how, in some competitive environments, goals can 'legitimise' all kinds of means, and how culture can exert a role in relation to what is seen as acceptable or unacceptable behaviour by individuals. In Investigation and Prevention of Financial Crime he addresses important topics including organized crime, money laundering, cyber crime,

corruption in law enforcement agencies, and whistleblowing, and provides expert advice about strategies for the use of intelligence to combat financial crime. The uniqueness of his approach to the subject lies in the way he is able to explain intelligence and intelligence processes in the wider context of knowledge and knowledge management. The numerous case studies throughout the book illustrate the 'policing' of financial crime from an intelligence, knowledge management and systems perspective. Law enforcers, lawyers, security personnel, consultants and investigators, as well as those in auditing and accountancy and with responsibilities for containing risk in banks, other financial institutions and in businesses generally, will find this an invaluable source of practical guidance. The book will also be of interest to advanced students and researchers in criminology and police science.

Software Engineering is a multifaceted and expanding topic. It aims to provide theories, methods and tools to tackle the complexity of software systems, from development to maintenance. Its complexity is made even more severe today by rapid advances in technology, the pervasiveness of software in all areas of society, and the globalization of software development. The continuous expansion of the field presents the problem of how to keep up for practitioners. For educators, the key questions are how should software engineers be educated and what are the core topics and key technologies? Even looking only at the last decade, the tremendous changes that have taken place in the software engineering industry, and in the industrial world in general, raise many questions. What are the effects of: Outsourcing? Distributed software development? Open source? Standardization? Software patents? Mod-driven development? How should these developments change the way we teach software engineering? Should textbooks be updated? Should software engineering play a different role in the computer science curriculum, for example, be more pervasive? How

are instructors in universities handling these issues? All these issues were discussed at the Software Education and Training sessions at the International Conference on Software Engineering (ICSE 2005) by leading researchers, educators, and practitioners in software engineering, who presented their—sometimes controversial—views and insights on software engineering education in the new millennium. In this volume we have collected some of the most representative and innovative approaches that were presented at the workshop. The authors revised their papers based on discussions at the conference and the comments they received from the reviews.

Aim of this dissertation is to provide organizations with a model and an application approach to configure their knowledge intensive processes with the functionalities offered by collaborative technologies. The model is structured into three segments: - attributes of knowledge intensive processes - functionalities of collaborative technologies - configurations of knowledge intensive processes and collaborative technologies The model is validated within three industrial case studies.

If this is your first time to New Delhi, you need to look on more objects which you could never forget in your lifetime. There is much to see and experience at The National Capital of Republic of India. The concept of Inter Disciplinary research was a topic of focus by various departments across the Engineering and Technology area. Flushing with major areas, this ICIDRET '15 has addressed the E&T areas like Mechanical Engineering, Civil Engineering, Electrical Engineering, Bio-Technology, Bio-Engineering, Bio-Medical, Computer Science, Electronics & Communication Engineering, Management and Textile Engineering. This focus has brought a new insight on the learning methodologies and the terminology of accepting the cross definition of engineering and the research into it. We invite you to join us in this inspiring conversation. I am pretty sure that this conference would indulge the information from the various parts of the world and could coin as a global research gathering. With more and more researchers coming into ICIDRET, this event would be as an annual event. This conference is sure that, this edition and the future edition will serve as a wise platform for the people to come with better research methodologies integrating each and every social component globally. If there would have been a thought of not integrating the RJ45 and few pieces of metal / plastic along with a PCB, today we could haven't used the telephones and mobile phones. With an ear-mark inspiration and constant support from the Global President Dr. S. Prithiv Rajan, ASDF International President Dr. P. Anbuoli, this publication stands in front of your eyes,

without them this would haven't been possible in a very shortest span. Finally, I thank my family, friends, students and colleagues for their constant encouragement and support for making this type of conference. -- Kokula Krishna Hari K Editor-in-Chief

This unique new textbook on Information Systems (IS) provides an answer to a few basic questions in the field: What is the scientific nature of IS? How do we design IS in today's connected world? What is the relationship between IS and innovation in knowledge economies? Whereas mainframe corporate computers tended to dominate the thinking in the 1980s, the dominating factor today is personal digital devices that connect the world as one whole IS. Network science is emerging to describe these digital connections (e.g., social networking), and service science is similarly emerging to describe service value networks. This book therefore synthesizes the emerging network science and service science with the classic IS theory, resulting in a new set of principles for IS strategic planning. It also reviews the standard IS topics of system analysis and database design, covering the whole spectrum of databases and all the major methods and techniques of database design. The role of IS as a technological innovation in the knowledge economy is also analyzed. In doing so, new concepts such as basic values of IS, systems of IS, sustainability of IS, IS as a service system, IS as a human value network, and the hyper-network model for innovation by IS, are developed.

Combating white-collar crime is a challenge as these criminals are found among the most powerful members of society, including politicians, business executives, and government officials. While there are many approaches to understanding this topic, Policing White-Collar Crime: Characteristics of White-Collar Criminals highlights the importance of police intelligence in confronting these crimes and criminals and focuses on the identification, retrieval, storage, and application of information resources.

Combining theory with case examples of some of the most notorious criminal enterprises in recent years, the book explores: White-collar crime typologies and characteristics The roles and structure in a white-collar crime enterprise Sociological perspectives on why women are substantially less involved in white-collar crime Why chief executives are vulnerable to the lure of white-collar crime Characteristics of victims who fall prey to these crimes Theoretically based yet practitioner-oriented, this book offers a unique study of the contingent approach to policing white-collar criminals—emphasizing the essential elements of information management strategy, knowledge management strategy, information technology strategy, and value configuration in law enforcement. By implementing the techniques presented in this volume, law enforcement organizations can better develop and implement detection and prevention methods. This effective use of the critical element of police intelligence is a powerful tool for circumventing the tactics of white-collar criminals.

In an era of rapidly shrinking resources, efficient utilization of public resources is of paramount importance. Health care, social services, education, law enforcement, and other fields have established their own standards against which program operations are assessed. National accrediting bodies have implemented systems of rigorous peer review to ensure the quality of program processes and outcomes. Nongovernmental organizations must demonstrate success in achieving their stated goals in order to sustain or expand program funding. In the 21st century, process (how programs are organized and how work is conducted) has become as important as outcomes in determining program effectiveness. Responding to these dynamic challenges, the authors utilize concrete case studies to immerse students in the techniques of program evaluation. They effectively examine systems theory, project planning, queuing theory,

cost-benefit analysis, and organization processes (including standards-based program accreditation), providing practical examples in an easy-to-comprehend style. In addition, comprehensive discussions explain how process intervention is utilized to achieve program adaptations and strategic change. Like its highly regarded predecessors, the latest edition features evaluation exercises designed to facilitate student development of indicators and measures when dealing with real-world programs. An Instructors Manual provides solutions to the case studies in the appendix of the text, further clarifying the program planning and evaluation process.
