This textbook provides the reader with thorough coverage of the role nutrition plays in enhancing one's health, fitness and sport performance. Modern research and practical activities are incorporated throughout.

Nutrition before, during and after training or a sporting event can improve the comfort, energy and performance of athletes of all levels, from elite to recreational, as well as providing long-term health benefits. Nutrition for Sport, Exercise and Performance offers a clear, practical and accessible guide to the fundamentals of sport and exercise nutrition. The expert authors begin by explaining key principles, including understanding energy systems, exercise physiology and metabolism. They cover the basics of digestion, absorption and nutrition; examine the key macronutrients and micronutrients essential for performance; and discuss the process of dietary assessment. Part 2 goes on to explore in detail nutrition for pre- and post-training, hydration, the use of supplements and body composition, and provides guidance on developing plans for both individual athletes and teams. The final component examines specific nutrition issues and special needs, including working with elite athletes, strength-and-power athletes, young, older and disabled athletes,

endurance sports, GI disturbances and rehabilitation issues. Cultural issues are also explored, including diets for vegan and vegetarian athletes, and religious perspectives and requirements. Featuring contributions from a range of sport and exercise nutrition professionals and including practical diet plans, diagrams and the latest research and evidence throughout, this is a core reference for undergraduates, nutritionists and trainers.

Sports Nutrition for Health Professionals merges the basic principles and latest evidence-based scientific understanding of sports nutrition with the real-world practical applications that health professional students must master to help their current and future clients to optimize athletic performance, overall satisfaction and success with sports and physical activity. Step-by-by, you'll learn about the scientific basis of sports nutrition and how to apply that knowledge to real-life situations and interactions with clients. You'll follow six different clients as they are evaluated by a variety of health professionals and undergo a series of assessments and self-administered tests. By seeing how the science of Sports Nutrition can be applied to sample clients, you will be able to take that knowledge and apply it to your future clients.

As sports have become more competitive over recent years researchers and trainers have been searching for new and innovative ways of improving

performance. Ironically, an area as mundane as what an athlete eats can have profound effects on fitness, health and ultimately, performance in competition. Sports have also gained widespread acceptance in the therapeutic management of athletes with disorders associated with nutritional status. In addition, exercise has been one of the tools used for studying the control of metabolism, creating a wealth of scientific information that needs to be placed in the context of sports medicine and science. Nutrition in Sport provides an exhaustive review of the biochemistry and physiology of eating. The text is divided into three sections and commences with a discussion of the essential elements of diet, including sections on carbohydrates, proteins, fats, vitamins and trace elements, and drugs associated with nutrition. It also discusses athletes requiring special consideration, including vegetarians and diabetics. The second section considers the practical aspects of sports nutrition and discusses weight control (essential for sports with weight categories and athletes with eating disorders), the travelling athlete (where travel either disrupts established feeding patterns or introduces new hazards), environmental aspects of nutrition (including altitude and heat), and the role of sports nutritional products.

teachers and students to explore the core principles of nutrition and to apply these throughout their training to foster critical thinking at all times. This NS Textbook on Sport and Exercise Nutrition has been written to cover the latest information on the science and practice of sport and exercise nutrition. A key concept behind this textbook is that it aims to combine the viewpoints of world leading nutrition experts from both academia/research and a practical stand point. Plus where necessary there are additional practitioner based authors to ensure theory is translated into practice for each chapter in the form of either 'practice tips' or 'information sheets' at the end of relevant chapters. The textbook in essence can be divided into three distinct but integrated parts: Part 1: covers the key components of the science that supports the practice of sport and exercise nutrition including comprehensive reviews on: nutrients both in general and as exercise fuels; exercise physiology; hydration, micronutrients; and supplements. Part 2: moves into focusing on specific nutrition strategies to support different types of training including: resistance; power/sprint; middle distance/speed endurance; endurance; technical/skill, team; and specific competition nutrition needs. The unique format of this textbook is that it breaks down nutrition support into training specific as opposed to the traditional sport specific support. This reflects the majority of current sport

and exercise requirements of the need to undertake concurrent training and therefore facilitating targeted nutrition support to the different training components through the various macro and micro training cycles.

Part 3: explores some of the practical issues encountered in working in the sport and exercise nutrition field and includes key sport related topics such as: disability sport; weight management; eating disorders; bone and gut health; immunity; injury; travel; and special populations and situations.
