Burns are one of the most devastating conditions encountered in medicine. The injuries affect people of all ages, both physically and psychologically, in the developed

and the developing world. The correct management of burns needs a skilled multidisciplinary approach and this ABC provides an overview of the most important aspects of burn injuries for healthcare professionals. This ABC book offers a comprehensive yet accessible review of burn management. It introduces the range of burns that a GP may become involved in treating or having treated at hospital. From explanations of how burns happen, through to first aid applications, pre-hospital treatment, dressings, resuscitation and the management of deep dermal burns. It also looks at the subsequent management of burns through hyperalimentation and microbiological management, reconstruction and rehabilitation. A significant contribution to an important area of care: burns are the second most common cause of accidental death in children in the UK. Early treatment of burns is essential to avoid disablement: impact on lungs, infection and later need for plastic surgery can all be reduced by appropriate assessment and prompt treatment. Includes contributions from the UK, USA and Australia, and has a chapter on international disasters. Presented in a clear and concise manner with many illustrations, this book will appeal to a wide readership including medical students, nurses, hospital doctors, and general practitioners.

Background: Information for immediate burn resuscitation and treatment has been available in many forms, most of which requires starting with the Parkland formula. Research in the last ten years has called that formula into question and has recommended either using it only as initial guidance or using another method all together. **Purpose:** To present a summary, in an unbiased format, of the information available for immediate burn fluid resuscitation especially that which has been published in the past 25 years. The primary focus is on the Parkland formula and its validity either as initial guidance or as a method for immediate treatment.

Methods: An exhaustive search of available medical literature using CINHALL, Medline-OVID, Medline-plus and UpToDate. Of those articles highlighted, 20 were found to have information pertaining only to general guidelines, to particular types of burns or to a specific pediatric or geriatric population. The final 12 articles were found to have pertinent and current information regarding the immediate fluid resuscitation of new onset burns and the value of the Parkland or other formula in doing so. All tables and data analyses were directly transferred from annotated sources. **Results:** The sum total of burn victims evaluated was over 1100 patients using various testing formats ranging from well-randomized to retrospective studies. The validity of each article is discussed and with the amount of available information, some are presented as supporting evidence

only. Given the advances in knowledge of burn treatment and resuscitation, the author recommends additional studies comparing purposeful dehydration versus the Parkland formula, with emphasis on the means for monitoring the Parkland formula results. Conclusion: Literature evidence has supported the Parkland formula in the past as a starting point for resuscitation, with the onus on the Provider for calculating appropriate amounts and adjusting based on careful monitoring. Recent studies have shown that the numbers from the Parkland formula are not reproducible. Therefore, the author recommends a larger study evaluating the Parkland formula as compared with Permissive Hypovolemia and other methods of resuscitation.
