The first chapters describe different forms of metallic corrosion and the effects of atmospheric corrodents such as sulfur-, nitrogen- and chlorine-containing compounds. They also discuss the corrosive effects of weathering conditions and natural media including water, acids, salts, organics, and gases. The remaining chapters are divided into metal types and their alloys. They cover stainless, ferritic, and martensitic steels as well as nickel alloys, copper, copper alloys, aluminum, titanium, zinc, and lead. Each chapter examines the corrosion potential of the material and provides easy-to-use charts that specify their compatibility with selected corrodents. The book also compares the corrosion resistance of nonferrous metals and alloys.

Instead of using expensive alloys to construct a tank or processing vessel, it is often more economical to use a less expensive metal, such as carbon steel, and install a lining to provide protection from corrosion. Corrosion of Linings and Coatings: Cathodic and Inhibitor Protection and Corrosion Monitoring offers focused coverage for professionals interested in protective linings and coatings, corrosion protection, and monitoring techniques. The author details various materials and methods for controlling and protecting against corrosion. He discusses the use of mortars, grouts, and monolithic surfaces and explains how the use of inhibitors and cathodic protection help prevent corrosion. The book also provides details for various types of linings materials and coatings and includes valuable compatibility charts for each material covered. The author concludes with an explanation of a variety of corrosion monitoring techniques currently available.
