A Christmas Carol in Prose, Being a Ghost Story of Christmas, usually known just as A Christmas Carol is a fairy-tale novel by a British classic Charles Dickens, that was published in 1843. It consists of five chapters, or staves as the author named them. Among all the stories from Christmas Books by Dickens this one became the most popular story about Christmas in Great Britain and outside the country. The main character is an old gloomy miser Ebenezer Scrooge, who doesn't love anyone or anything except his money. He doesn't understand why everybody is so happy about Christmas and with disgust, refuses the invitation from his kind nephew to celebrate this holiday together with his family. On Christmas Eve, the ghost of his former business partner Jacob Marley appeared in front of Scrooge, and it changed him drastically...

This latest collection of Maplin projects are a variety of power supply projects, the necessary components for which are readily available from the Maplin catalogue or any of their high street shops. Projects include, laboratory power supply projects for which there are a wide range of applications for the hobbyist, from servicing portable audio and video equipment to charging batteries; and miscellaneous projects such as a split charge unit for use in cars or similar vehicles when an auxiliary battery is used to power 12v accessories in a caravan or trailer. Both useful and innovative, these projects are above all practical and affordable.

A distinction is made in formal semantics between "stage-level predicates," predicates that describe the general state of a noun, and "individual-level predicates," predicates that specify the specific properties of a noun. Fernald investigates various contexts in which this distinction is traditionally said to come into play. His aim is to show that the effects displayed are not uniform, and that the differences between the analyses proposed in the literature arise from the authors considering different subsets of data that they take to exemplify the "core" meaning of the stage/individual distinction. Fernald presents alternatives and extensions that shed light on the limitations of previous theories, as well as making original observations about important aspects of the topic, including coercion, and perceptual reports vs. other phenomena.

Will they find what they're looking for? Will they teach a fish to fetch? Will they be accidentally eaten? Find out in the all-ages adventure from #1 New York Times bestselling author, Tom Taylor (Injustice: Gods Among Us, All-New Wolverine, Star Wars: Adventures) and James Brouwer (Justice League Beyond). Designed for teaching astrophysics to physics students at advanced undergraduate or beginning graduate level, this textbook also provides an overview of astrophysics for astrophysics graduate students, before they delve into more specialized volumes. Assuming background knowledge at the level of a physics major, the textbook develops astrophysics from the basics without requiring any previous study in astronomy or astrophysics. Physical concepts,

mathematical derivations and observational data are combined in a balanced way to provide a unified treatment. Topics such as general relativity and plasma physics, which are not usually covered in physics courses but used extensively in astrophysics, are developed from first principles. While the emphasis is on developing the fundamentals thoroughly, recent important discoveries are highlighted at every stage.

This book encompasses the exciting developments and challenges in the fast-moving and rapidly expanding research field of single-molecule kinetic analysis of cell signaling that promises to be one of the most significant and exciting areas of biological research for the foreseeable future. Cell signaling is carried out by complicated reaction networks of macromolecules, and single-molecule analyses has already demonstrated its power to unravel complex reaction dynamics in purified systems. To date, most of the published research in the field of single-molecule processes in cells, focus on the dynamic properties (translational movements of the centre of mass) of biological molecules. However, we hope that this book presents as many kinetic analyses of cell signaling as possible. Although single-molecule kinetic analysis of cellular systems is a relatively young field when compared with the analysis of single-molecule movements in cells, this type of analysis is highly important because it directly relates to the molecular functions that control cellular behavior and in the future, single-molecule kinetic analysis will be largely directed towards cellular systems. Thus, we hope that this book will be of interest to all those working in the fields of molecular and cell biology, as well as biophysics and biochemistry.

Who knew science could be so smelly??? This innovative book is a complete exploration of the olfactory system, with a side of gross-out hilarity. First, it tackles the basics, from why things stink to how our sense of smell works (hint: it has to do with the six million scent receptors way up inside our noses). Then, it moves on to some specifics such as the link between smells and memories, some of the stinkiest stinks on Earth, the chemicals smells are made of and more! The eww! on every page is sure to hold every young scientist's attention!
