Weaves together biblical exposition and practical application to demonstrate how emotions relate to the Christian life. Emotions are a vital part of what it means to be a human being made in the image of God and redeemed in Jesus Christ. But often our emotions confuse and mislead us. So what is the proper place for emotions in a Christian's walk of faith? In *Feelings and Faith* Brian Borgman draws from his extensive biblical knowledge and his pastoral experience to help readers understand both divine and human emotions. After laying a biblical foundation he moves on to practical application, focusing on how Christians can put to death ungodly emotional displays and also cultivate godly emotions. This biblically informed, practical volume is helpful for pastors, counselors, and serious-minded Christians who wish to develop a full-orbed faith that encompasses their emotional life.

Flight Dynamics takes a new approach to the science and mathematics of aircraft flight, unifying principles of aeronautics with contemporary systems analysis. While presenting traditional material that is critical to understanding aircraft motions, it does so in the context of modern computational tools and multivariable methods. Robert Stengel devotes particular attention to models and techniques that are appropriate for analysis, simulation, evaluation of flying qualities, and control system design. He establishes bridges to classical analysis and results, and explores new territory that was treated only inferentially in earlier books. This book combines a highly accessible style of presentation with contents that will appeal to graduate students and to professionals already familiar with basic flight dynamics. Dynamic analysis has changed dramatically in recent decades, with the introduction of powerful personal computers and scientific programming languages. Analysis programs have become so pervasive that it can be assumed that all students and practicing engineers working on aircraft flight dynamics have access to them. Therefore, this book presents the principles, derivations, and equations of flight dynamics with frequent reference to MATLAB functions and examples. By using common notation and not assuming a strong background in aeronautics, Flight Dynamics will engage a wide variety of readers. Introductions to aerodynamics, propulsion, structures, flying qualities, flight control, and the atmospheric and gravitational environment accompany the development of the aircraft's dynamic equations.
