This symposium series volume was developed in order to share papers presented at the 245th ACS National Meeting on the topic of pilot plants. The Industrial and Chemical Engineering, Applied Chemical Technology Subdivision hosted a one-day symposium for industry and academic researchers to present and share their work and best practices on operations and safety in pilot plant environments. Designing and building "pilot plants" can be a big challenge, and this volume outlines the proper operations needed to run a plant safely, in both academic and industrial environments. The book addresses issues like chemical separation, chemical reactions, waste generation, process controls, and spatial considerations, as well as safety precautions. It describes ways in which plant designers and contractors can consider ease of operation, maintenance, pinch-points, and sampling, among other aspects. In contrast to workers in large-scale facilities, pilot plant workers in both industry and academia are not only exposed to hazardous substances, they are exposed to such materials in a smaller setting and thus to potentially greater concentrations. This book brings together workers and researchers in pilot plant environments to present and share their best practices as regards operations and safety.

The Federal Aviation Administration (FAA) has published the Private Pilot - Airplane Airman Certification Standards (ACS) document to communicate the aeronautical knowledge, risk management, and flight proficiency standards for the private pilot certification in the airplane category, single-engine land and sea; and multiengine land and sea classes. This ACS incorporates and supersedes the previous Private Pilot Practical Test Standards for Airplane, FAA-S-8081-14. The FAA views the ACS as the foundation of its transition to a more integrated and systematic approach to airman certification. The ACS is part of the safety management system (SMS) framework that the FAA uses to mitigate risks associated with airman certification training and testing. Specifically, the ACS, associated guidance, and test question components of the airman certification system are constructed around the four functional components of an SMS: Safety Policy that defines and describes aeronautical knowledge, flight proficiency, and risk management as integrated components of the airman certification system; Safety Risk Management processes through which internal and external stakeholders identify and evaluate regulatory changes, safety recommendations and other factors that require modification of airman testing and training materials; Safety Assurance processes to ensure the prompt and appropriate incorporation of changes arising from new regulations and safety recommendations; and Safety Promotion in the form of ongoing engagement with both external stakeholders (e.g., the aviation training industry) and FAA policy divisions. The FAA has developed this ACS and its associated guidance in collaboration with a diverse group of aviation training experts. The goal is to drive a systematic approach to all components of the airman certification system, including knowledge test question development and conduct of the practical test. The FAA acknowledges and appreciates the many hours that these aviation experts have contributed toward this goal. This level of collaboration, a hallmark of a robust safety culture, strengthens and enhances aviation safety at every level of the airman certification system.
