Failure often presents a valuable learning opportunity, however, students may need motivational scaffolds to protect them from the negative psychological ramifications of failure. This work explored the effectiveness of a motivation-based intervention called an ego-protective buffer (EPB), that was designed to enhance persistence after failure. An ego-protective buffer (EPB) maintains a stable sense of competence by lessening the impact of failure on one's psyche. The specific instantiation of an EPB tested here was designed to elicit a combination of internal and external attributions for failure. External attributions protect one's sense of competence by averting the blame for failure away from the self, while internal attributions encourage students to take some responsibility for remedying the failure situation. Based on this theory, we embedded an EPB into the rule structure of a computer-based genetics game and unleashed it on 143 seventh graders. In the EPB condition, students were told that winning in the game was a probabilistic outcome, dependent on a combination of chance and skill on the part of the students. In the Control condition, students were told that winning in the game was a deterministic outcome, dependent on students' skill only. Students played the game during two class periods. Measures include pre- and posttests, motivational survey measures, and in-game behaviors. The EPB did have an effect on learning, but only amongst high-failing students. High-failing EPB students learned just as much as their low-failing counterparts. This was not so in the Control condition, where high-failing students learned far less than their low-failing counterparts. So the high-failing EPB group was behaving as if they were "buffered" from the effects of failure. We also found evidence of a possible mechanism behind this learning effect. In the high-failing EPB condition, students were equally likely to persist after success and failure, while in the Control condition, students were far more likely to persist after success, exhibiting risk averse behaviors. This difference was more exaggerated in a within-subjects comparison, contrasting the same individuals in situations of high and low failure. Finally, persistence after failure was associated with learning across the full sample of subjects. Regardless of condition or failure rate, students who persisted more after failure also learned more. This study, together with the author's related body of work, provides compelling evidence that an EPB is a viable intervention for encouraging persistence in the face of failure.

Experiments which in previous years were made with ornamental plants have already afforded evidence that the hybrids, as a rule, are not exactly intermediate between the parental species. With some of the more striking characters, those, for instance, which relate to the form and size of the leaves, the pubescence of the several parts, etc., the intermediate, indeed, is nearly always to be seen; in other cases, however, one of the two parental characters is so preponderant that it is difficult, or quite impossible, to detect the other in the hybrid. from 4. The Forms of the Hybrid One of the most influential and important scientific works ever written, the 1865 paper Experiments in Plant Hybridisation was all but ignored in its day, and its author, Austrian priest and scientist GREGOR JOHANN MENDEL (1822-1884), died before seeing the dramatic long-term impact of his work, which was rediscovered at the turn of the 20th century and is now considered foundational to modern genetics. A simple, eloquent description of his 1856-1863 study of the inheritance of traits in pea plants Mendel analyzed 29,000 of them this is essential reading for biology students and readers of science history. Cosimo presents this compact edition from the 1909 translation by British geneticist WILLIAM BATESON (1861-1926).

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives.

Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.
