Nowadays MicroPython is becoming one of the most popular programming tools for embedded systems. MicroPython allows you to control hardware connected to the MicroPython board, write code modules expanding the features of your program, store them on an SD card for later use, and much more. MicroPython comes with modules for interacting with the hardware such as interrupts, timers, LEDs, ADC, DAC, PWM and other peripherals. Virtually MicroPython allows you to gain complete and direct control of the hardware, but in practice many essential capabilities of MicroPython remain unused. This book aims to cover many hidden aspects of hardware control and code optimization for the popular boards based upon the STM32F4xx microcontrollers. This book is not for absolute beginners. It is assumed that you already have some experience and practical skills in MicroPython programming and understand the basics of Cortex-M CPU. The material of this book

The micro:bit, a tiny computer being distributed by the BBC to students all over the UK, is now available for anyone to purchase and play with. Its small size and low power requirements make it an ideal project platform for hobbyists and makers. You don't have to be limited by the web-based programming solutions, however: the hardware on the board

is deceptively powerful, and this book will teach you how to really harness the power of the micro:bit. You'll learn about sensors, Bluetooth communications, and embedded operating systems, and along the way you'll develop an understanding of the next big thing in computers: the Internet of Things.

Program Arduino with ease! Using clear, easy-to-follow examples, *Programming Arduino: Getting Started with Sketches* reveals the software side of Arduino and explains how to write well-crafted sketches using the modified C language of Arduino. No prior programming experience is required! The downloadable sample programs featured in the book can be used as-is or modified to suit your purposes.

Understand Arduino hardware fundamentals  
Install the software, power it up, and upload your first sketch  
Learn C language basics  
Write functions in Arduino sketches  
Structure data using arrays and strings  
Use Arduino's digital and analog inputs and outputs in your programs  
Work with the Standard Arduino Library  
Write sketches that can store data  
Program LCD displays  
Use an Ethernet shield to enable Arduino to function as a web server  
Write your own Arduino libraries  
In December 2011, Arduino 1.0 was released. This changed a few things that have caused two of the sketches in this book to break. The change that has caused trouble is that the classes 'Server' and 'Client' have been renamed to 'EthernetServer' and 'EthernetClient' respectively. To fix this: Edit sketches 10-01 and 10-02 to replace all occurrences of the word 'Server' with 'EthernetServer' and all occurrences of 'Client' with 'EthernetClient'. Alternatively, you can download the modified sketches for 10-01 and 10-02 from here:

Python is a powerful, expressive programming language that's easy to learn and fun to use! But books about learning to program in Python can be kind of dull, gray, and boring, and that's no fun for anyone. Python for Kids brings Python to life and brings you (and your parents) into the world of programming. The ever-patient Jason R. Briggs will guide you through the basics as you experiment with unique (and often hilarious) example programs that feature ravenous monsters, secret agents, thieving ravens, and more. New terms are defined; code is colored, dissected, and explained; and quirky, full-color illustrations keep things on the lighter side. Chapters end with programming puzzles designed to stretch your brain and strengthen your understanding. By the end of the book you'll have programmed two complete games: a clone of the famous Pong and "Mr. Stick Man Races for the Exit"—a platform game with jumps, animation, and much more. As you strike out on your programming adventure, you'll learn how to:

- Use fundamental data structures like lists, tuples, and maps
- Organize and reuse your code with functions and modules
- Use control structures like loops and conditional statements
- Draw shapes and patterns with Python's turtle module
- Create games, animations, and other graphical wonders with tkinter

Why should serious adults have all the fun? Python for Kids is your ticket into the amazing world of computer programming. For kids ages 10+ (and their parents) The code in this book runs on almost anything: Windows, Mac, Linux, even an OLPC laptop or Raspberry Pi!

Learn how you can control LEDs, make music, and read sensor data using popular microcontrollers such as Adafruit Circuit Playground, ESP8266, and the BBC micro:bit

programming, and networking concepts with MicroPython

**Book Description** MicroPython is an open source implementation of Python 3 that runs in embedded environments. With MicroPython, you can write clean and simple Python code to control hardware instead of using complex low-level languages like C and C++. This book guides you through all the major applications of the MicroPython platform to build and program projects that use microcontrollers. The MicroPython book covers recipes that'll help you experiment with the programming environment and hardware programmed in MicroPython. You'll find tips and techniques for building a variety of objects and prototypes that can sense and respond to touch, sound, position, heat, and light. This book will take you through the uses of MicroPython with a variety of popular input devices and sensors. You'll learn techniques for handling time delays and sensor readings, and apply advanced coding techniques to create complex projects. As you advance, you'll get to deal with Internet of Things (IoT) devices and integration with other online web services. Furthermore, you'll also use MicroPython to make music with bananas and create portable multiplayer video games that incorporate sound and light animations into the game play. By the end of the book, you'll have mastered tips and tricks to troubleshoot your development problems and push your MicroPython project to the next level!

What you will learn

- Execute code without any need for compiling or uploading using REPL (read-evaluate-print-loop)
- Program and control LED matrix and NeoPixel drivers to display patterns and colors
- Build projects that make use of light, temperature, and touch sensors
- Configure devices to create Wi-Fi access points and use network modules to scan and connect to existing networks
- Use Pulse Width Modulation to control DC motors and servos
- Build an IoT device to display live weather data from the Internet at the
