

Recycling The City The Use And Reuse Of Urban Land

This teaching text discusses the details of full loop recycling. Covers the special topics that buyers & purchasing agents must face before they will become committed to buying recycled in an effort to help everyone understand the problems of perception that must be overcome. Also provides information on where to purchase recycled products & gives tips about getting to know the products. Discusses how to create the demand for recycled products. Illustrated.

This book highlights the significance of urban agricultural production, the technologies and methods for supplying organic materials to the farmland, recovering plant nutrients and energy in cities, and systems for sustaining farmlands in order to produce agricultural crops and supply safe food to citizens. Focusing on the effective recycling of biomass waste generated in cities for use in organic farming, it discusses alternatives to traditional composting, such as carbonizing organic waste, which not only produces recyclable materials but also converts organic waste into energy. Recycling discarded organic matter appropriately and reusing it as both material and energy is the basis of new urban organic farming, and represents a major challenge for the next generation of urban agriculture. As such, the book presents advanced research findings to facilitate the implementation of safe, organic agricultural production with only a small environmental load.

A clear and practical examination of complex issues, *Local Economic Development and the Environment: Finding Common Ground* provides a broad, academic look at the intersection of two important areas for local administrators. In addition to managing development in a strained economic climate, most administrators are also expected to be stewards of the environment. However, economic conditions often leave them with limited options for pursuing economic development and, at the same time, being environmentally mindful. Many find themselves without a clear understanding of the concepts, tools, and best practices available to accomplish this herculean task. Translating complex environmental and economic concepts into easily applicable practices, the book: Gives practitioners the information they need to communicate with consultants, constituents, and officials, and to avoid ideological obstacles Compares regulatory differences between states and other geographical differences Includes examples from across the country to highlight variations in environmental regulations and laws Provides technical, legal, and political insights into the process of pursuing local economic development projects that incorporate protection and awareness Contains case studies that demonstrate the concepts in action, allowing readers to fully grasp the complexities associated with sustainable economic development Discusses how local administrators can balance the economic and environmental needs of the future Bridging the gap between policy-making intention and outcome, this book connects readers with a larger body of research that not only underpins practical applications but also helps them avoid legal, technical, and political obstacles. It provides an arsenal of best practices and everyday, easy-to-use strategies for optimizing the difficult balance between economic development and environmental protection.

Prevention, Recycling & Conservation initiatives are explored in a way that makes them easier for students to understand. What is conservation, what are natural, renewable and non-renewable resources? We also look at methods used to reduce the landfill waste by composting along with how organic materials are broken down. Written to grade and using simplified language and vocabulary we discover prevention methods for waste and pollution contaminating fresh water resources along with prevention initiatives caused by burning fossil fuels which pollute the atmosphere causing smog, depleted ozone and greenhouse gases. As well we introduce alternative fuels, zero waste goals and sustainable living methods. Our resource is comprised of ready-to-use reading passages, student activities, test prep, and color mini posters for remedial students. All of our content is aligned to your State Standards and are written to Bloom's Taxonomy.

The first illustrated guidebook that answers the age-old question: Can I Recycle This? Since the dawn of the recycling system, men and women the world over have stood by their bins, holding an everyday object, wondering, "can I recycle this?" This simple question reaches into our concern for the environment, the care we take to keep our homes and our communities clean, and how we interact with our local government. Recycling rules seem to differ in every municipality, with exceptions and caveats at every turn, leaving the average American scratching her head at the simple act of throwing something away. Taking readers on a quick but informative tour of how recycling actually works (setting aside the propaganda we were all taught as kids), *Can I Recycle This* gives straightforward answers to whether dozens of common household objects can or cannot be recycled, as well as the information you need to make that decision for anything else you encounter. Jennie Romer has been working for years to help cities and states across America better deal with the waste we produce, helping draft meaningful legislation to help communities better process their waste and produce less of it in the first place. She has distilled her years of experience into this non-judgmental, easy-to-use guide that will change the way you think about what you throw away and how you do it.

This book provides valuable insights into how cities are innovating in the field of the sharing economy through case studies. Each chapter explains how different cities have employed the sharing economy to solve their sui generis problems. The concept of Sharing Cities is getting considerable traction with grassroots groups and city governments around the world. Starting with the earliest Sharing City, Seoul, under the efforts of different Sharing Economy Associations and Organizations, more and more cities are being transformed. This book aims to highlight the positive changes that the sharing economy brings to cities and will be a valuable reference to those working in this emerging field.

With issues of climate change, increase in urban population and the increased demand for water from competing sectors, wastewater recycling is becoming an important strategy to complement the existing water resources for both developing and developed countries. There are lessons, experiences, data and technology that can be shared for mutual benefit. The current paper is part of a doctoral research and presents a comprehensive literature review on the following issues in India and Australia: some key statistics of wastewater use and recycling; rationale for wastewater use; problems in promoting recycling; research gaps; economic characteristics of wastewater; wastewater markets and its future potential.

City on the Line is about a revolution in public budgeting. It is the story of a hard luck city fighting through the Great Recession, a budget director trying to lead disruptive change, and a groundbreaking effort to link strategy, budget and data to get better results for residents.

This book gathers high-quality research papers presented at the Seventh International Conference on Solid Waste Management, held at Professor Jayashankar Telangana State Agricultural University, Hyderabad on December 15-17, 2017. The Conference, IconSWM 2017, is as an official side event of the high-level Intergovernmental Eighth Regional 3R Forum in Asia and the Pacific. As a pre-event, it also aims to generate scientific inputs to the policy consultations at the Eighth Regional 3R Forum co-organised by the UNCRD/UNDESA, MoEFCC India, MOUD India and MOEJ, Japan. At the IconSWM 2017, researchers from more than 30 countries presented their work on Solid Waste Management. Divided into three volumes, this book shares their papers, which address various issues related to innovation and implementation in sustainable waste management, segregation, collection and transportation of waste, treatment technologies, policies and strategies, energy recovery, life cycle analysis, climate change, and research and business opportunities.

Recycling the CityThe Use and Reuse of Urban LandLincoln Inst of Land Policy

Households in the UK each generate around one tonne of waste per year, and the successful management and disposal of this waste is becoming an increasingly important issue. In many cases, recycling is the most sensible option, and the UK government has set a target to recycle a quarter of all household waste by the year 2000. This book gives an overview of the waste management and disposal options currently available, and provides a comprehensive and up-to-date analysis of how recycling could develop. The author – one of the UK's leading experts – looks at how much of the waste is potentially recyclable, shows the various ways in which recyclable materials can be separated and reprocessed, and assesses the existing markets for recyclable materials. He gives an in-depth account of the important subject of packaging recycling, and compares the UK's progress and performance with what is happening elsewhere in Europe. He also discusses how the performance of current recycling schemes can be measured and costed, and forecasts future developments in the industry. Dr Richard Waite is a former Specialist Advisor to the House of Commons Environment Select Committee and is currently a consultant with Coopers & Lybrand. He established one of the first commercial MRFs in the country, and has advised many local authorities, central government departments (including the European Commission) and private sector organisations on recycling issues. Originally published in 1995

The recycling and reuse of materials and objects were extensive in the past, but have rarely been embedded into models of the economy; even more rarely has any attempt been made to address the scale of these practices. Recent developments, including the use of large datasets, computational modelling, and high-resolution analytical chemistry are increasingly offering the means to reconstruct recycling and reuse, and even to approach the thorny issue of quantification. This volume is the first to bring together these new approaches, and the first to present a consideration of recycling and reuse in the Roman economy, taking into account a range of materials and using a variety of methodological approaches. It presents integrated, cross-referential evidence for the recycling and reuse of textiles, papyrus, statuary and building materials, amphorae, metals, and glass, and examines significant questions about organization, value, and the social meaning of recycling.

How the success and popularity of recycling has diverted attention from the steep environmental costs of manufacturing the goods we consume and discard. Recycling is widely celebrated as an environmental success story. The accomplishments of the recycling movement can be seen in municipal practice, a thriving private recycling industry, and widespread public support and participation. In the United States, more people recycle than vote. But, as Samantha MacBride points out in this book, the goals of recycling—saving the earth (and trees), conserving resources, and greening the economy—are still far from being realized. The vast majority of solid wastes are still burned or buried. MacBride argues that, since the emergence of the recycling movement in 1970, manufacturers of products that end up in waste have successfully prevented the implementation of more onerous, yet far more effective, forms of sustainable waste policy. Recycling as we know it today generates the illusion of progress while allowing industry to maintain the status quo and place responsibility on consumers and local government. MacBride offers a series of case studies in recycling that pose provocative questions about whether the current ways we deal with waste are really the best ways to bring about real sustainability and environmental justice. She does not aim to debunk or discourage recycling but to help us think beyond recycling as it is today.

This collection of essays examines underutilized, abandoned, and vacant urban land within political, economic, institutional, and policy contexts. The 11 chapters raise the essential questions: Is vacant land an opportunity or an obstacle? Are brownfields a legacy of prior industrial wealth, or of illegal and dangerous contamination? Is a land inventory vital to community needs for future growth, or the symbol of political shortsightedness? Is the reclamation of land the first step in an urban turnaround, or a giveaway of local assets?

Assembling papers originally presented at the Resilient Cities 2011 Congress in Bonn, Germany (June 2011), the second global forum on cities and adaptation to climate change, this volume is the second in a series resulting from this annual event. These cutting-edge papers represent the latest research on the topic and reflect the intensification of the debate on the meaning of and interaction between climate adaptation, risk reduction and broader resilience. Thus, contributors offer more material related to resilience, such as water, energy and food security; green infrastructure; the role of renewables and ecosystem services; vulnerable communities and urban poor; and responsive financing for adaptation and multi-level governance. Overall, the book brings a number of different perspectives to bear on the most pressing issues and controversies surrounding climate change adaptation in cities. These papers will prove invaluable to anyone interested in deepening their understanding of urban resilience and contributing to tackling climate change at the local level.
