

Residential Construction Academy Carpentry 3rd Third Edition By Vogt Floyd Published By Cengage Learning 2011

A celebration of craftsmanship, teamwork, and the relationship between contractor and client. "An enriching and poetic tribute to manual labour."—Karl Ove Knausgaard Making Things Right is the simple yet captivating story of a loft renovation, from the moment master carpenter and contractor Ole Thorstensen submits an estimate for the job to when the space is ready for occupation. As the project unfolds, we see the construction through Ole's eyes: the meticulous detail, the pesky splinters, the problem solving, patience, and teamwork required for its completion. Yet Ole's narrative encompasses more than just the fine mechanics of his craft. His labor and passion drive him toward deeper reflections on the nature of work, the academy versus the trades, identity, and life itself. Rich with descriptions of carpentry and process, Making Things Right is a warm and humorous portrayal of a tightknit working community, a story about the blood, sweat, and frustration involved in doing a job well and the joys in seeing a vision take shape.

Construction productivity--how well, how quickly, and at what cost buildings and infrastructure can be constructed--directly affects prices for homes and consumer goods and the robustness of the national economy. Industry analysts differ on whether construction industry productivity is improving or declining. Still, advances in available and emerging technologies offer significant opportunities to improve construction efficiency substantially in the 21st century and to help meet other national challenges, such as environmental sustainability. Advancing the Competitiveness and Efficiency of the U.S. Construction Industry identifies five interrelated activities that could significantly improve the quality, timeliness, cost-effectiveness, and sustainability of construction projects. These activities include widespread deployment and use of interoperable technology applications; improved job-site efficiency through more effective interfacing of people, processes, materials, equipment, and information; greater use of prefabrication, preassembly, modularization, and off-site fabrication techniques and processes; innovative, widespread use of demonstration installations; and effective performance measurement to drive efficiency and support innovation. The book recommends that the National Institute of Standards and Technology work with industry leaders to develop a collaborative strategy to fully implement and deploy the five activities

The National Institute for Occupational Safety and Health (NIOSH) conducts construction-relevant research activities. From 1996 through 2005, the program focused on four research goals: reducing traumatic injuries and fatalities; reducing exposure to health hazards; reducing major risks associated with musculoskeletal disorders; increasing the understanding of construction industry attributes and factors for improving health and safety outcomes. In this book, the

National Research Council evaluates the relevance and impact of the NIOSH Construction Research Program in terms of its research priorities and its connection to improvements in the protection of workers in the workplace. It also assesses the program's identification and targeting of new research areas, to identify emerging research issues, and to provide advice on ways that the program might be strengthened. The book finds that the efforts of the Construction Research Program have made meaningful contributions to improving construction worker safety and health, and provides overarching and specific recommendations for continuing progress. While NIOSH cannot set and enforce research-based standards on its own, the program can be expected to help reduce construction workplace fatalities, injuries, and illnesses through its research, its research dissemination, and transfer into practice.
