Charity's Children tells the true story of the training of a cardiovascular surgeon, from his internship

through his year as chief resident at Charity Hospital, one of the world's largest and most important teaching hospitals. This story is set in the early days of cardiac surgery-the late 1960s through 1970s, when today's technology was not yet available. The author takes you into his life, from the lowest-level intern performing round-the-clock tasks and duties to his later role as teacher with the life-and-death responsibilities. Readers witness in detail the emergency trauma and elective cardiovascular cases that were performed. Initially, Ciaravella wanted only to document the many "only at Charity" stories that he had been involved with or that had been passed down from his Charity-trained surgeon father. He was, however able to interview thirty of his contemporaries who were either chief residents when he was an intern or, now-practicing surgeons that were interns or junior residents when he was chief resident. The early history of Charity is chronicled, as are the professors who significantly impacted his life and his training. His section titled "Breaking News" describes in detail several major events that rocked the city of New Orleans, and details how they impacted Charity Hospital with never-before-told eye witness accounts of sacrifice and dedication.

This new book is the first full account, inside or outside government, of China's efforts to acquire foreign technology. Based on primary sources and meticulously researched, the

book lays bare China's efforts to prosper technologically through others' achievements. For decades, China has operated an elaborate system to spot foreign technologies, acquire them by all conceivable means, and convert them into weapons and competitive goods—without compensating the owners. The director of the US National Security Agency recently called it "the greatest transfer of wealth in history." Written by two of America's leading government analysts and an expert on Chinese cyber networks, this book describes these transfer processes comprehensively and in detail, providing the breadth and depth missing in other works. Drawing upon previously unexploited Chinese language sources, the authors begin by placing the new research within historical context, before examining the People's Republic of China's policy support for economic espionage, clandestine technology transfers, theft through cyberspace and its impact on the future of the US. This book will be of much interest to students of Chinese politics, Asian security studies, US defence, US foreign policy and IR in general.

The sun is the source of energy for life on earth and is the strongest modulator of the human physical environment. In fact, the Sun's influence extends throughout the solar system, both through photons, which provide heat, light, and ionization, and through the continuous outflow of a magnetized, supersonic ionized gas known as the solar wind. While the accomplishments of the past decade have answered important questions about the physics of the Sun, the interplanetary medium, and the space environments of Earth and other solar system bodies, they have also highlighted other questions, some of which are long-standing and fundamental. The Sun to the Earth and Beyond organizes these questions in terms of five challenges that are expected to be the focus of scientific investigations in solar and space physics during the coming decade and beyond. Cases of listeriosis appear to be predominantly associated with ready-to-eat products.
