Using real-world implementation examples to illustrate their points, the authors cover all aspects of network design, including network components, network architectures, topologies, protocols, application interactions, and more.

Managing Systems Migrations and Upgrades is the perfect book for technology managers who want a rational guide to evaluating the business aspects of various possible technical solutions. Enterprises today are in the middle of the R&D race for technology leadership, with providers who increasingly need to create markets for new technologies while shortening development, implementation, and life cycles. The cost for the current tempo of technology life cycles is endless change-management controls, organizational chaos, production use of high-risk beta products, and greater potential for failure of existing systems during migration. Burkey and Breakfield help you answer questions such as, "Is the only solution open to me spending more than the industry average in order to succeed?" and "What are the warning signs that tell me to pass on a particular product offering?" as well as "How can my organization avoid the 'technical death marches' typical of the industry?"

This book will take the confusion out of when to make shifts in your systems and help you evaluate the value proposition of these technology changes. · Provides a methodology for decision making and implementation of upgrades and migrations · Avoids marketing hype and the "technical herding" instinct · Offers a tool to optimize technology changes for both staff and customers

The Fourth Edition of Kneib & Neill continues to serve as a reference aid for research, to provide the historical context to current research, and most importantly as an aid for graduate teaching on a broad range of topics in human and comparative reproduction. In the decade since the publication of the last edition, the study of reproductive physiology has undergone monumental changes. Chief among these advances are in the areas of stem cell development, signaling pathways, the role of inflammation in the regulatory processes in the various tissues, and the integration of new animal models which have led to a greater understanding of human disease. The new edition synthesizes all of this new information at the molecular, cellular, and organismal levels of organization and present modern physiology a more understandable and comparative context. The Fourth Edition has been extensively revised, reflecting new fundamental advancements in this rapidly advancing field. Provides a common language for researchers across the fields of physiology, endocrinology, and biology to discuss their understanding of reproduction. Saves academic researchers time

in quickly accessing the very latest details on reproductive physiology, as opposed to searching through thousands of journal articles.

The second edition of Primary Immunodeficiency Diseases presents discussions of gene identification, mutation detection, and clinical and research applications for over 100 genetic immune disorders--disorders featuring an increased susceptibility to infections and, in certain conditions, an increased rate of malignancies and autoimmune disorders. Since the publication of the first edition, a flurry of new disease entities has been defined and new treatment regimens have been introduced, the most spectacular being successful treatment by gene therapy for two genotypes of combined immunodeficiency. The first edition marked a historic turning point in the field of immunodeficiencies, demonstrating that many of the disorders of the immune system could be understood at a molecular level. This new edition can proudly document the tremendous pace of progress in dissecting the complex immunologic networks responsible for protecting individuals from these disorders.

Nowadays, assisted reproductive technologies (ARTs) have a pivotal role not only in achieving fertilization in subfertile animals, but they are also involved in the management of the herd, decreasing disease spread and even allowing offspring sex selection. Nonetheless, there are differences between species or even within species that have led researchers worldwide to focus on those differences in order to bypass these specific difficulties. This Special Issue, titled "The Era of Assisted Reproductive Technologies Tailored to the Specific Necessities of Species, Industry and Case Reports" and published in *Animals*, is composed of 12 original manuscripts and three reviews that offer an overview of current and future ARTs used to improve reproductive outcomes, mainly focused on farm animals, such as horse, pig, bovine, rabbit and ovine species. Thus, the Special Issue covers information from the classical point of view, including comparative studies of different semen extenders, to the most advanced technologies of sperm selection by thermotaxis or chemoattractants, as well as the improvement of sperm features by red light irradiation. The female and embryo contributions to ART outcomes are also covered, for instance, with a study that improves our knowledge by the metabolomic description of follicular fluid composition or the description of better culture conditions of oocytes. In brief, this Special Issue provides a balanced overview of emerging techniques and technologies used to preserve, improve, rescue or even create fertility for domestic farm animals with high economic impact.

The incarceration rate in the United States is the highest of any developed nation, with a prison population of approximately 2.3 million in 2016. Over 700,000 prisoners are released each year, and most face significant educational, economic, and social disadvantages. In *After Prison*, sociologist David Harding and criminologist Heather Harris provide a comprehensive account of young men's experiences of reentry and reintegration in the era of mass incarceration. They focus on the unique challenges faced by 1,300 black and white youth aged 18 to 25 who were released from Michigan prisons in 2003, investigating the lives of those who achieved some measure of success after leaving prison as well as those who struggled with the challenges of creating new lives for themselves. The transition to young adulthood typically includes school completion, full-time employment, leaving the childhood home, marriage, and childbearing, events that are disrupted by incarceration. While one quarter of the young men who participated in the study successfully transitioned into adulthood—achieving employment and residential independence and avoiding arrest and incarceration—the same number of young men remained deeply involved with the criminal justice system, spending on average four out of the seven years after their initial release re-incarcerated. Not surprisingly, whites are more likely to experience success after prison. The authors attribute this racial disparity to the increased stigma of criminal records for blacks, racial discrimination, and differing levels of social network support that connect whites to higher quality jobs. Black men earn less than white men, are more concentrated in industries characterized by low wages and job insecurity, and are less likely to remain employed once they have a job. The authors demonstrate that families, social networks, neighborhoods, and labor market, educational, and criminal justice institutions can have a profound impact on young people's lives. Their research indicates that residential stability is key to the transition to adulthood. Harding and Harris make the case for helping families, municipalities, and non-profit organizations provide formerly incarcerated young people access to long-term supportive housing and public housing. A remarkably large number of men in this study eventually enrolled in college, reflecting the growing recognition of college as a gateway to living wage work. But the young men in the study spent only brief spells in college, and the majority failed to earn degrees. They were most likely to enroll in community colleges, trade schools, and for-profit institutions, suggesting that interventions focused on these kinds of schools are more likely to be effective. The authors suggest that, in addition to helping students find employment, educational institutions can aid reentry efforts for the formerly incarcerated by providing supports like childcare and paid apprenticeships. *After Prison* offers a set of targeted policy interventions to improve these young people's chances: lifting restrictions on federal financial aid for education, encouraging criminal record sealing and expungement, and reducing the use of incarceration in response to technical parole violations. This book will be an important contribution to the fields of scholarly work on the criminal justice system and disconnected youth.

The main causes of morbidity and mortality in diabetes are macrovascular and microvascular complications, including atherosclerosis, nephropathy, and retinopathy. As the definition of atherosclerosis as a chronic, smoldering, inflammatory disease has gained general acceptance, the attention of researchers has focused on the triggers of chronic vascular inflammation. The oxidation and other forms of

modification of lipids and lipoproteins have emerged as a major pathogenic factor in atherosclerosis, with a significant interaction with the immune system. Modified lipoproteins by themselves are proinflammatory through the activation of the innate immune system as a consequence of the interaction with scavenger receptors and/or toll-like receptors expressed by a variety of cell types, including phagocytic cells and dendritic cells. A variety of modified forms of LDL (mLDL), including oxidized, malondialdehyde-modified, and Advanced Glycation End-product-modified LDL induce autoimmune responses in humans. Those modifications seem enhanced in diabetes, and the progression of atherosclerosis is accelerated in diabetic patients. The immune response to all forms of mLDL results in both activation of T cells in the arterial wall and in an autoimmune response characterized by the formation of IgG antibodies. Both arms of the immune response are believed to play a role in vascular inflammation. While the cell response is likely to activate resident macrophages, the humoral immune response results in the production of IgG antibodies that bind to specific epitopes in modified forms of LDL, generate immune complexes both intra- and extravascularly, and those complexes are able to activate the classical pathway of the complement system as well as phagocytic cells via Fc γ receptors. In vitro studies suggest that the pro-inflammatory activity of immune complexes containing mLDL is several-fold higher than that of the modified LDL molecules by themselves. Clinical studies have provided significant support to the pathogenic role of immune complexes containing modified LDL in the development of atherosclerotic complications in patients with both type 1 and type 2 diabetes. At the same time, there is increasing evidence that the formation of immune complexes containing modified forms of LDL may also be involved in the pathogenesis of diabetic nephropathy and retinopathy. These are areas in which more research is needed to fully understand the pathogenic mechanisms activated by those immune complexes. Of interest is the fact that animal models have suggested the possibility of modifying the adaptive humoral immune response in ways that would result in slowing down, and perhaps prevent, the atherosclerotic process. This possibility is sufficiently alluring as to justify increased research efforts, both in animal models (including diabetic animals) and translational clinical studies. The manipulation of the T regulatory population is another area of potential translational impact, which has hardly been explored. Indeed at this point of time, what seems to be a high priority is an increased and open interchange of information among investigators, trying to reach a better general understanding and integration of knowledge generated from a variety of approaches and perspectives. This Research Topic provided an optimal platform for this open interchange of information. We encouraged interested scientists to submit mini-reviews, methods papers, review articles, perspectives and original research articles covering this topic in all its diversity to facilitate the communication of perspectives and new information between scientists interested in understanding the multiple implications of the involvement of the immune system in the pathogenesis of diabetic complications.
