**Novel Research about Biomechanics and Biomaterials Used in Hip, Knee and Related Joints** J. Philippe Kretzer, Catherine Van Der Straeten, 2021-08-18 Joint replacement is a very successful medical treatment. However, the survivorship of hip, knee, shoulder, and other implants is limited. The degradation of materials and the immune response against degradation products or an altered tissue loading condition as well as infections remain key factors of their failure. Current research in biomechanics and biomaterials is trying to overcome these existing limitations. This includes new implant designs and materials, bearings concepts and tribology, kinematical concepts, surgical techniques, and anti-inflammatory and infection prevention strategies. A careful evaluation of new materials and concepts is required in order to fully assess the strengths and weaknesses and to improve the quality and outcomes of joint replacements. Therefore, extensive research and clinical trials are essential. The main aspects that are addressed in this Special Issue are related to new material, design and manufacturing considerations of implants, implant wear and its potential clinical consequence, implant fixation, infection-related material aspects, and taper-related research topics. This Special Issue gives an overview of the ongoing research in those fields. The contributions were solicited from researchers working in the fields of biomechanics,

biomaterials, and bio- and tissue-engineering.

**Computational Biomechanics of the Hip Joint** Mohammed Rafiq Abdul Kadir, 2013-09-19 This book presents analyses of the most commonly reported failure modes of hip stems: loosening and thigh pain; both are attributed to the relative motion and instability at the bone-implant interface due to failure to achieve sufficient primary fixation. The book investigates various factors that could affect primary stability and therefore the long-term outcome of hip arthroplasty. The results complement experimental work carried out in this area as in-vitro experiments have several limitations that could be addressed through computer simulations.

**Engineering Design Applications II** Andreas Öchsner, Holm Altenbach, 2019-06-27 This book offers an update on recent developments in modern engineering design. Different engineering disciplines, such as mechanical, materials, computer and process engineering, provide the foundation for the design and development of improved structures, materials and processes. The modern design cycle is characterized by the interaction between various disciplines and a strong shift to computer-based approaches where only a few experiments are conducted for verification purposes. A major driver for this development is the increased demand for cost reduction, which is also linked to environmental demands. In the transportation industry (e.g. automotive or aerospace), the demand for higher fuel efficiency is related to reduced operational costs and less environmental damage. One way to fulfil such requirements is lighter structures and/or improved processes for energy conversion. Another emerging area is the interaction of classical engineering with the health and medical sector.

Hip Joint Restoration Joseph C. McCarthy, Philip C. Noble, Richard N. This practical guide and accessible reference text gives an overall picture of the present status of the resources that are available. Though more than 500,000 total hip replacements are performed worldwide each year, their eventual failure is becoming an ever-increasing problem. This comprehensive book gives clear advice on the most up-to-date method of revision surgery for failed hip prostheses, with emphasis on the management of bone stock loss. Chapters cover the whole spectrum of revision hip arthroplasty of the hip ranging from diagnosis and management of infection to tissue banking, femoral reconstruction, impaction grafting, and acetabular revision.
