Fire has historically played a role in forests and ranges of the inland Northwest. This guide has been prepared to help managers understand the role of fire and the potential uses of fire and to plan for fire use in managing these lands. Sections deal with these topics, and steps in planning a prescribed burn are outlined. A sample burning situation illustrates the planning and execution of a prescribed burn. References are given to help the reader locate pertinent information.

*Shelving Guide: Environmental Engineering* In-situ burning is recognized as a viable alternative for cleaning up oil spills on land and water. It can rapidly reduce the volume of spilled oil and eliminate the need to collect, store, transport, and dispose of recovered oil, and can also shorten the response time to a spill, thus reducing the chances that the spill will spread on the water surface or further into land. This book will serve as a comprehensive reference for all aspects of in-situ burning of oil spills and include the scientific aspects of the burning process and the related effects, as well as practical information about the procedures to be followed and equipment required for carrying out an in-situ burn. Features Serves as a complete source of information on in-situ burning as well as practical guide on how to implement the procedures. Explains procedures for burning in different situations, including on water, land, and ice. Provides information on worker health and safety precautions during burning. Covers several different types of emissions, their environmental fate, and how to monitor them. Includes numerous illustrative case studies.

*Global Biomass Burning* provides a convenient and current reference on such topics as the remote sensing of biomass burning from space, the geographical distribution of burning; the combustion products of burning in tropical, temperate, and boreal ecosystems; burning as a global source of atmospheric gases and particulates; the impact of biomass burning gases and particulates on global climate; and the role of biomass burning on biodiversity and past global extinctions."--Pub. desc.

Libraries preserve the knowledge and ideas on which rights depend; no wonder they are so often attacked. Richard Ovenden tells the history of this deliberate destruction of knowledge--from library burnings to digital attacks and contemporary underfunding--and makes a passionate plea for the importance of these threatened institutions.

This book presents a global and historical perspective of energy flows during the last millennium. The search for sustainable energy is a key issue dominating today's energy regime. This book details the historical evolution of energy, following the overlapping and slow flowing transitions from one regime to another. In doing so it seeks to provide insight into future energy transitions and the means of utilizing sustainable energy sources to reduce humanity's fossil fuel footprint. The book begins with an examination of the earliest and most basic forms of energy use, namely, that of humans metabolizing food in order to work, with the first transition following the domestication and breeding of horses and other animals. The book also examines energy sources key to development during the industrialization and mechanization, such as wood and coal, as well as more recent sources, such as crude oil and nuclear energy. The book then assesses energy flows that are at the forefront of sustainability, by examining green sources, such as solar, wind power and hydropower. While it is easy to see energy flows in terms of "revolutions," transitions have taken centuries to evolve, and transitions are never fully global, as, for example, wood remains the primary fuel source for cooking in much of the developing world. This book not only demonstrates the longevity of energy transitions but also discusses the possibility for reducing transition times when technological developments provide inexpensive and safe energy sources that can reduce the dependency on fossil fuels. This book will be of great interest to students and scholars of energy transitions, sustainable energy and environmental and energy history.

For three centuries, as the Black Death rampaged through Europe and the Reformation tore the Church apart, tens of thousands were arrested as witches and subjected to torture and execution, including being burned alive. This graphic novel examines the background; the witch hunters' methods; who profited; the brave few who protested; and how the Enlightenment gradually replaced fear and superstition with reason and science. Famed witch hunters Heinrich Kramer, architect of the infamous *Malleus Maleficarum*, and Matthew Hopkins, England's notorious "Witchfinder General," are covered as are the Salem Witch Trials and the last executions in Europe.

'The Burning Time' is Book 5 of the alternative history series *Timeline 10/27/62*. It is February 1964 in a World in which the 'swinging sixties' never happened. The atomic mushroom clouds over the Mediterranean have dispersed and now as the World teeters on the brink of a new thermonuclear war, it is dawning on the 'victors' that their 'victory', far from being absolute, was tragically pyrrhic. In the uneasy half-peace the United States stirs from its post-Cuban Missiles War slumber. But will it awaken soon enough to overcome its own divisions to confront the new and terrible forces unleashed by Red Dawn's first paroxysm of violence? Now is a time for betrayal. Now is judgement day when all the mistakes of the months since the October War will come back to haunt the 'victors'. \_\_\_\_\_ This re-proofed, re-formatted and re-presented edition was uploaded on 24th August 2017.

When, in the winter of 1691, accusations of witchcraft surface in her small New England village, twelve-year-old Mary Chase fights to save her mother from execution.

A serial killer leaves a college coed to die in the California desert, his signature of fire seared into her flesh.... A beautiful Chinese-American detective, recently transferred from Chinatown to the Upper West Side, is assigned a routine missing-persons case... A famous doctor returns home from a lecture to discover that his actress wife has been living a secret life.... Now, the paths of the cop, the killer, and the psychiatrist are about to converge.... A savage killer is on the loose in New York City. His calling card is a tattoo of flames; his trail of victims leads from

the scorched sands of California to the blistering heart of Manhattan. Only Detective April Woo can block this vicious madman's next move. And with the help of psychiatrist Jason Frank, this NYPD policewoman will prove that the predator she's hunting is no ordinary killer--but then, April Woo is no ordinary cop.

The wood-fired boiler at the Vermont State Hospital in Waterbury, Vermont was investigated in order to identify environmental and economic problems associated with increased use of wood as fuel. The investigators observed that the low amount of stack emissions contained particulates that were extremely effective light scatterers. An analysis of the entire system was performed in order to investigate the particulate growth and the conversion of gaseous material to particulates within the system. Initial findings indicate that a good deal of particulate formation takes place within and after the cyclone, thus rendering the cyclone somewhat ineffective in this system. Meteorological data were acquired in the vicinity of the experimental site. Background concentrations were measured using hi-vol samplers and a Tracer experiment was performed to indicate the direction of plume travel. These data were incorporated into the Los Alamos Visibility Model to simulate the actual appearance of the plume with a variety of boiler sizes. This simulation gives one an indication of how large a boiler, sited in this location, can be before the opacity of the plume becomes aesthetically offensive. An economic assessment of the wood burning activities at Waterbury and a number of other sites is included in this report.

Smithfield, settled on the fringes of Roman London, was once a place of revelry. Jesters and crowds flocked for the medieval St Bartholomew's Day celebrations, tournaments were plentiful and it became the location of London's most famous meat market. Yet in Tudor England, Smithfield had another, more sinister use: the public execution of heretics. The Burning Time is a vivid insight into an era in which what was orthodoxy one year might be dangerous heresy the next. The first martyrs were Catholics, who cleaved to Rome in defiance of Henry VIII's break with the papacy. But with the accession of Henry's daughter Mary - soon to be nicknamed 'Bloody Mary' - the charge of heresy was leveled against devout Protestants, who chose to burn rather than recant. At the center of Virginia Rounding's vivid account of this extraordinary period are two very different characters. The first is Richard Rich, Thomas Cromwell's protégé, who, almost uniquely, remained in a position of great power, influence and wealth under three Tudor monarchs, and who helped send many devout men and women to their deaths. The second is John Deane, Rector of St Bartholomew's, who was able, somehow, to navigate the treacherous waters of changing dogma and help others to survive. The Burning Time is their story, but it is also the story of the hundreds of men and women who were put to the fire for their faith.

The origin of the Israelites is one of the most frequently discussed issues among archaeologists and biblical scholars. Only a few decades ago, biblical stories such as the Conquest were heralded as confirmed by archaeology. But in the 1970s, Thomas L. Thompson and John Van Seters were in the vanguard of a movement among scholars that was intent on reassessing the historical reliability of the biblical narratives. This reassessment gained momentum during the 1980s and 1990s; today, the mainstream opinion is that there was no Conquest, and the Israelites, if they can be identified as a national entity or as a people, did not arrive in Canaan by means of a military conquest. For three days in March 2004, a group of scholars met to consider the state of the question and to provide a response to the predominant academic skepticism, a response that considers the biblical text to be an important datum in the construction of the history of the people of Israel. To do so, the authors of the papers read at the conference take into account both biblical and extrabiblical literary evidence, as well as the contributions of archaeology, to describe as completely as possible what may be known about the early history of Israel. Critical Issues in Early Israelite History publishes the papers read at this conference in the hope that the result will be a balanced portrayal of this watershed event based on all of the currently available evidence.

Almost fifteen years have now elapsed since the first observations of persistent spectral hole-burning in inhomogeneously broadened absorption lines in solids. The fact that the spectral shape of an inhomogeneously broadened line can be locally modified for long periods of time has led to a large number of investigations of low-temperature photophysics and photochemistry that would not have been possible otherwise. Using hole burning, important information has been obtained about a variety of interactions, including excited-state dephasing processes, host-guest dynamics, proton tunnelling, low-frequency excitation in amorphous hosts, relaxation mechanisms for vibrational modes, photochemical mechanisms at liquid helium temperatures, and external field perturbations. At the same time, the possibility that persistent spectral holes might be used to store digital information has led to the study of materials and configurations for frequency-domain optical storage and related possible applications. This is the first full-length book on persistent spectral hole-burning. The goal is to provide a broadly based survey of the scientific principles and applications of persistent spectral hole-burning. Since the topic is quite interdisciplinary, the book is intended for researchers, graduate students, and advanced undergraduates in the fields of chemical physics, solid-state physics, laser spectroscopy, solid-state photochemistry, and high-performance optical storage and optical processing.
