This volume deals with some of the multiple systems that growth factors and cytokines affect. The role of growth factors and cytokines on foetal development, in the immune and haemopoietic systems as well as in the skeletal and reproductive systems are covered. Various cancers are examined in a number of the chapters. This is the third and concluding volume of the treatise on growth factors and cytokines in health and disease.

The Retinoids: Biology, Biochemistry, and Disease provides an overview and synthesis of the retinoid molecules, from basic biology to mechanisms of diseases and therapy. Divided into five sections, the book covers retinoic acid signaling from biochemical, genetic, developmental, and clinical perspectives. The text is divided into five sections, the first of which examines vitamin A metabolic and enzymatic pathways. Focus then shifts to the role of retinoic acid signaling in development, and then to retinoids and physiological function. The book concludes with chapters on retinoids, disease and therapy. Comprehensive in scope and written by leading researchers in the field, The Retinoids: Biology, Biochemistry, and Disease will be an

essential reference for biologists, biochemists, geneticists and developmental biologists, as well as for clinicians and pharmacists engaged in clinical research involving retinoids. Modern medicine in England as we know it today is chiefly the product of the scientific developments of the nineteenth century. These advances included improved sanitation, the acceptance of the germ theory of disease as a result of the emergence of microbiology, and the advent of painless and routine surgical procedures. How then did medicine evolve in Lancaster during the nineteenth century? The focus here is the history of medicine in Lancaster and a community of practice amongst a few medical professionals who shaped Lancaster's medical landscape. The reader will be introduced to these remarkable medical men and their names will gradually become familiar. Many of these individuals were second and even third generation surgeons and physicians. Background to these pioneers, as well as their successes and failures, is sketched within the context of Lancaster's socio-economic environment and growth as an industrial town. This volume also marks the main medical events in Lancaster, including the establishment of a Dispensary, which evolved into the Royal Lancaster Infirmary, the Public Health movement and the rise of the Asylums.

Classical scholarship tends to treat anonymous authorship as a problem or game—a defect to be repaired or mystery to be solved. But anonymity can be a source of meaning unto itself, rather than a gap that needs filling. Tom Geue's close readings of Latin texts show what the suppression or loss of a name can do for literature.

The Cytokines of the Immune System catalogs cytokines and links them to physiology and pathology, providing a welcome and hugely timely tool for scientists in all related fields. In cataloguing cytokines, it lists their potential for therapeutic use, links them to disease treatments needing further research and development, and shows their utility for learning about the immune system. This book offers a new approach in the study of cytokines by combining detailed guidebook-style cytokine description, disease linking, and presentation of immunologic roles. Supplies new ideas for basic and clinical research Provides cytokine descriptions in a guidebook-style, cataloging the origins, structures, functions, receptors, disease-linkage, and therapeutic potentials Offers a textbook-style view on the immune system with the immunologic role of each cytokine Metal ions play key roles in biology. Many are essential for catalysis, for electron transfer and for the fixation, sensing, and metabolism of gases. Others compete with

those essential metal ions or have toxic or pharmacological effects. This book is structured around the periodic table and focuses on the control of metal ions in cells. It addresses the molecular aspects of binding, transport and storage that ensure balanced levels of the essential elements. Organisms have also developed mechanisms to deal with the non-essential metal ions. However, through new uses and manufacturing processes, organisms are increasingly exposed to changing levels of both essential and non-essential ions in new chemical forms. They may not have developed defenses against some of these forms (such as nanoparticles). Many diseases such as cancer, diabetes and neurodegeneration are associated with metal ion imbalance. There may be a deficiency of the essential metals, overload of either essential or non-essential metals or perturbation of the overall natural balance. This book is the first to comprehensively survey the molecular nature of the overall natural balance of metal ions in nutrition, toxicology and pharmacology. It is written as an introduction to research for students and researchers in academia and industry and begins with a chapter by Professor R J P Williams FRS.

This book is made possible by the enthusiastic contributions of the authors of the chapters. They have been invited from young and active scientists in the field of t-PA research. I am grateful for their contribution and for the fact that all accepted the specifications of their chapter in order to obtain a structured book. Inevitably, some overlap does exist; on the one hand to enable controversial or unsettled

areas to be discussed by the different experts with a different approach and background. It is a particular pleasure and honor that Dr. T. Astrup, as an eye-witness and essential contributor to the history of t-PA discovery and research, gives a unique account of the history of t-PA research in the first chapter of the book.

The life and chemical sciences are in the midst of a period of rapid and revolutionary transformation that will undoubtedly bring societal benefits but also have potentially malign applications, notably in the development of chemical weapons. Such concerns are exacerbated by the unstable international security environment and the changing nature of armed conflict, which could fuel a desire by certain States to retain and use existing chemical weapons, as well as increase State interest in creating new weapons; whilst a broader range of actors may seek to employ diverse toxic chemicals as improvised weapons. Stark indications of the multi-faceted dangers we face can be seen in the chemical weapons attacks against civilians and combatants in Iraq and Syria, and also in more targeted chemical assassination operations in Malaysia and the UK. Using a multi-disciplinary approach, and drawing upon an international group of experts, this book analyses current and likely near-future advances in relevant science and technology, assessing the risks of their misuse. The book examines

the current capabilities, limitations and failures of the existing international arms control and disarmament architecture – notably the Chemical Weapons Convention – in preventing the development and use of chemical weapons. Through the employment of a novel Holistic Arms Control methodology, the authors also look beyond the bounds of such treaties, to explore the full range of international law, international agreements and regulatory mechanisms potentially applicable to weapons employing toxic chemical agents, in order to develop recommendations for more effective routes to combat their proliferation and misuse. A particular emphasis is given to the roles that chemical and life scientists, health professionals and wider informed activist civil society can play in protecting the prohibition against poison and chemical weapons; and in working with States to build effective and responsive measures to ensure that the rapid scientific and technological advances are safeguarded from hostile use and are instead employed for the benefit of us all.
